

## **FOREWORD**

This report is the forty-sixth in the IAEA's series of annual reports on operating experience with nuclear power stations in Member States.

As in previous years, in addition to annual performance data and outage information, the report contains a historical summary of performance and outages during the lifetime of individual plants and figures illustrating worldwide performance and statistical data. In order to provide enhanced features such as data searching and analysis, the report has been published electronically on a CD-ROM since 2006.

The intent behind this report and all related Agency publications is to provide a useful tool for everyone concerned with nuclear power. Suggestions and corrections from readers would be most welcome.

# 1. INTRODUCTION

This report is the forty-sixth in the IAEA's series of annual publications on operating experience with nuclear power stations in Member States.

The publication provides annual performance data and outage information for individual nuclear power plants from around the world. Summaries of historical performance and outages during the lifetimes of those plants are also included. In order to provide a broad picture of nuclear power usage six figures have been added to illustrate global operational statistics through 2014.

The data which forms the basis of the publication is a direct output from the IAEA's Power Reactor Information System (PRIS), the databank of which contains all performance data published in the IAEA's operating experience annual reports since 1970, as well as basic information on power reactors, including design data. It presents operating experience data for all worldwide nuclear power plants from the start date of their commercial operation. The PRIS databank is available free of charge to IAEA Member States through its public website and on-line application PRIS-Statistics. The web-site [www.iaea.org/pris](http://www.iaea.org/pris) contains publicly available information about reactor units and nuclear industry results. PRIS-Statistics (<http://pris.iaea.org>) allows direct access to the database through the Internet. This application allows registered users to generate statistical outputs through pre-designed reports and filters.

When analysing the performance of nuclear reactors, indicators such as energy production, load, operation, and availability factors are often used. Energy unavailability factors, categorized separately for planned and unplanned unavailability (due either to causes under plant management control or external causes out of plant management control), are used as a measure of energy loss when a unit is not available to the grid on full power. Despite efforts to properly classify unavailability data, some ambiguity remains in the operators' reports since there is an inherent difficulty in finding energy losses caused by load following operation and by grid limitation for externally facilitated unavailabilities. Therefore, for load, operation, and unavailability factors, there may be differences between the data compiled in this report and data published elsewhere. In order to avoid confusion, refer to the definitions in Section 2.

As of 31 December 2014, there were 438 operational nuclear power reactors worldwide, with a total capacity of 376.2 GW(e). This represents an increase of some 4.5 GW(e) in total capacity, compared to the 2013 figures. There were five new grid connections in 2014: Atucha-2 in Argentina; Fangjiashan-1, Fuqing-1 and Ningde-2 in China; and Rostov-31 in Russia.

In Japan all 48 operational reactor units were kept off-line in 2014. This influenced worldwide statistics on nuclear power reactor performance.

Of the operational reactors, approximately 81.5% are light water moderated and cooled reactors; 11.2% are heavy water moderated and cooled reactors; 3.4% are light water cooled and graphite moderated reactors; and 3.4% are gas cooled reactors. Two reactors are liquid metal cooled fast reactors.

Three constructions of new reactors began during 2014; a figure that is significantly lower than the ten construction starts which occurred in 2013. Construction work started at Barakah-3 in the United Arab Emirates (UAE); Belarusian-2 in Belarus; and Carem in Argentina.

In 2014 one reactor unit, namely Vermont Yankee in the USA, was officially declared as permanently shutdown. This is five reactors fewer than in 2013.

As of 31 December 2014, 70 reactors were under construction. As in previous years, expansions as well as near and long term growth prospects remain centred in Asia, particularly in China. Of these 70 reactors under construction, 46 are in Asia, as are 32 of the last 40 new reactors to have been connected to the grid since 2004.

This report also catalogues the use of nuclear power reactors for non-electrical applications. Section 6 provides production data related to district heating, industrial process heat delivery, and water desalination. In 2014, 11 Member States utilized nuclear energy from 75 reactors for non-electrical applications.

Similarly to the previous year's edition, the 2015 edition contains detailed design characteristics of reactor units and dashboards with a general overview of each individual operating nuclear power reactor.

Information received by the IAEA through 8 April 2015 is included in this publication; All commercially operating units had reported data up to this date. Any modifications received at a later date, although not included in this publication, are available in the PRIS database.

The information contained in the report was made available to the IAEA through designated national correspondents. The IAEA appreciates the valuable assistance of the national authorities, official correspondents, and various electrical utilities in gathering the information for this report.

This report was compiled by staff of the Agency's Division of Nuclear Power. It is hoped that the report will serve as a useful tool for nuclear power plant operators, nuclear system designers, nuclear power planners, professional engineers, scientists, and others concerned with the operating experience of nuclear power reactors. Suggestions and corrections from readers are most welcome.

## 2. DEFINITIONS

### 1. Reference unit power, RUP [ $\text{MW}_{(e)}$ ]

The maximum (electrical) power that could be maintained continuously throughout a prolonged period of operation under reference ambient conditions.

It is specified that this value must remain constant for a given unit unless, following permanent modification, or a new permanent authorization, the management decides to amend the original value.

The reference unit power may be gross or net:

- The gross RUP ( $P_g$ ,  $\text{MW}_{(e)}$ ) is deemed to be measured at the output terminals of all generator sets in the station.
- The net RUP ( $P_n$ ,  $\text{MW}_{(e)}$ ), indicating the maximum power that can be supplied, is measured at the station outlet terminals, i.e. after deducting the power taken by station auxiliaries and the losses in the transformers that are considered integral parts of the station.

### 2. Design net capacity [ $\text{MW}_{(e)}$ ]

The net reference unit power as specified in an original unit design.

### 3. Reference period, T [hours]

For units in power ascension at the end of the period, the clock hours from the beginning of the period or the first electrical production, whichever comes last, to the end of the period.

For units in commercial operation at the end of the period, the clock hours from the beginning of the period or of commercial operation, whichever comes last, to the end of the period or permanent shutdown, whichever comes first.

### 4. On-line hours, t [hours]

The total clock hours in the reference period during which the unit operated with breakers closed to the station bus.

### 5. Reference energy generation, REG [ $\text{MW}_{(e)}\text{h}$ ]

Net electrical energy which would have been supplied to the grid if the unit were operated continuously at the reference unit power during the whole reference period.

### 6. Energy generated (net), EG [ $\text{GW}_{(e)}\text{h}$ ]

Net electrical energy produced during the reference period as measured at the unit outlet terminals, i.e. after deducting the electrical energy taken by unit auxiliaries and the losses in transformers that are considered integral parts of the unit. If this quantity is less than zero, zero is reported.

## 7. Load factor, LF [%]

$$LF = \frac{EG}{REG} \times 100$$

EG = energy generated (net), [MW<sub>(e)</sub>h]  
REG = reference energy generation [MW<sub>(e)</sub>h]

Load factor is the ratio of the energy that the power unit has produced over a given period, to the energy it would have produced at its reference power capacity over that period.

## 8. Operation factor, OF [%]

$$OF = \frac{t}{T} \times 100$$

t = number of hours on-line [h]  
T = number of hours in the reference period [h]

Operation factor is the ratio of the number of hours the unit was on-line, to the total number of hours in the reference period, expressed as a percentage. It is a measure of the unit time availability on the grid and does not depend on the operating power level.

## 9. Available capacity, P [MW<sub>(e)</sub>]

Maximum net capacity at a given moment at which the unit or station is able or is authorized to be operated at a continuous rating under the prevailing conditions assuming unlimited transmission facilities.

## 10. Energy loss, EL [MW<sub>(e)</sub>h]

Energy which could have been produced during the reference period by using the unavailable capacity; it is categorized into three types:

- PEL - planned energy loss
- UEL - unplanned energy loss
- XEL - energy loss due to causes external to the plant

UEL comprises shutdowns, unplanned load reductions or outage extensions.

## 11. Unavailability

A status when the plant is not able to operate at its maximum capacity (reference power). This condition, which may be under or beyond plant management control, should only reflect lack of availability of the plant itself, regardless of energy demand, transmission grid condition or political situation in the country.

Unavailability is classified as planned if it is foreseen at least 4 weeks in advance, generally at the time when the annual overhaul programme is established, and if the beginning of the unavailability period can be largely controlled and deferred by management. Unavailability is classified as unplanned if not scheduled at least four weeks in advance. Power plant operation at lower than maximum capacity because of lower demand from the grid but occurring while the plant is available to operate at the maximum capacity, does not constitute unavailability, either planned or unplanned.

## 12. Energy availability factor, EAF [%]

$$EAF = \frac{REG - PEL - UEL - XEL}{REG} \times 100$$

The energy availability factor is the ratio of the energy that the available capacity could have produced over a specified period, to the energy that the reference unit power could have produced during the same period.

### 13. Energy unavailability factor, EUF [%]

$$EUF = \frac{EL}{REG} \times 100$$

The unavailability factor is the ratio of the energy losses EL that have not been produced during a specified period due to the unavailable capacity, to the energy that the reference unit power could have produced during the same period.

The energy unavailability factor EUF over a specified period can be divided into:

PUF = planned unavailability factor

UUF = unplanned unavailability factor due to causes in the plant

XUF = unplanned unavailability factor due to causes external to the plant.

The unavailability factor can be expressed as:  $EUF = 100 - EAF$

### 14. Unit capability factor, UCF [%]

$$UCF = \frac{REG - PEL - UEL}{REG} \times 100$$

Unit capability factor is defined as the ratio of the energy that the unit was capable of generating over a given time period considering only limitation under the plant management control, to the reference energy generation over the same time period, expressed as a percentage. Both of these energy generation terms are determined relative to reference ambient conditions.

### 15. Unplanned capability loss factor, UCL [%]

$$UCL = \frac{UEL}{REG} \times 100$$

Unplanned capability loss factor is defined as the ratio of the unplanned energy losses during a given period of time, to the reference energy generation, expressed as a percentage. Unplanned energy loss is energy that was not produced during the period because of unplanned shutdowns, outage extensions, or unplanned load reductions due to causes under plant management control. Causes of energy losses are considered to be unplanned if they are not scheduled at least four weeks in advance.

### 16. Construction start

Date when first major placing of concrete, usually for the base mat of the reactor building, is carried out.

### 17. First criticality

Date when the reactor is made critical for the first time.

### 18. Grid connection

Date when the plant is first connected to the electrical grid to supply power.

### 19. Commercial operation

Date when the plant is handed over by the contractors to the owner and officially declared to be in commercial operation.

## **20. Permanent shutdown**

Date when the plant is officially declared shut down by the owner and taken out of operation permanently.

## **21. Long term shutdown (Suspended operation)**

A unit is considered in the long term shutdown status, if it has been shut down for an extended period (usually several years) without initially having any firm recovery schedule but where there is the intention of re-starting the unit eventually.

## **22. Outages**

For the purpose of PRIS coding, the outage is defined as any status of a reactor unit, when its actual output power is lower than the reference unit power for a period of time. By this definition, the outage includes both power reduction and unit shutdown. The outage is considered significant, if the loss in the energy production corresponds to at least ten hours of continuous operation at the reference unit power or if it has been caused by an unplanned reactor scram (even if the unit is shut down for less than 10 hours).

## **23. Outage duration [h]**

The total clock hours of the outage measured from the beginning of the reference period or the outage, whichever comes last, to the end of the reference period or the outage, whichever comes first.

**24. Factors** refer to the plants which were in commercial operation during the whole of the reference period.

**25. Cumulative factors** are given for the plants which were in commercial operation during full calendar years.

**26.** A blank and three periods (...), if used in tables, denote information that is not applicable or not available, respectively.

## **27. Types of outages**

The outage type is a three-character code. The third character is for unplanned outages only:

Code\_1 description:

- (P) Planned outage due to causes under the plant management control
- (U) Unplanned outage due to causes under the plant management control
- (X) Outage due to causes beyond the plant management control ("external")

Code\_2 description:

### 4. 2014 Summary of Operation

AT THE BEGINNING OF THE YEAR 2014 THE PLANT HAD A LIMITED AMOUNT OF HOURS OF OPERATION LEFT UNTIL ITS END OF LIFE. THE GRID OPERATOR STARTED TO MANAGE THAT LIMITED GENERATION TIME IN SUCH A WAY THAT THEY BEGAN REQUESTING TO EMBALSE NPP TO GENERATE POWER DURING THE SEASONAL PEAKS DEMAND. THAT SITUATION CONTINUES UP TO THE PRESENT.

**4. 2014 Summary of Operation**

- ON 28TH FEBRUARY, AT 03:18AM DURING THE EXECUTION OF THE PI-124A (TEST PERFORMANCE OF SECURITY DEVICES - INJECTION SAFETY - TRAIN B - RELAY K602) PROCEDURE, THE STEAM ISOLATION VALVE HV-4521 WAS CLOSED WHICH CAUSED AN INCREASE IN PRESSURE OF THE SG (STEAM GENERATOR-2) AND OF THE FLOW OF STEAM IN THE SG-1. THE CLOSURE OF MAIN FEED WATER ISOLATION VALVES HV 1300 AND 1301 OCCURRED AND AS A CONSEQUENCE AN AUTOMATIC REACTOR TRIP OCCURRED BY HIGH PRESSURE IN THE PRESSURIZER (PZR).- ON MAY THE 5TH, AT 11:39 AM A SCRAM OCCURRED DUE TO A TURBINE TRIP CAUSED BY A LEAK IN THE TURBINE CONTROL SYSTEM FLUID.THE LEAKAGE OF THE TURBINE CONTROL SYSTEM FLUID OCCURRED IN THE PIPE FLANGE CONNECTION TO THE INTERCEPTING VALVE IV-2A, WHICH CAUSED LOW FLUID LEVEL IN THE RESERVOIR AND LOW PRESSURE IN THE SYSTEM, AND AS A CONSEQUENCE THE REACTOR TRIPPED.

### 4. 2014 Summary of Operation

JANUARY - POWER REDUCTION DUE TO HIGH TEMPERATURE IN THE COOLING WATER OF THE LOAD BREAKER SWITCH. MAY - REDUCED POWER FOR ENGINE BEARING EXCHANGE MAIN COOLING WATER PUMP JULY - INITIATED THE STRETCH OUT OF THE CYCLE 11 IN THE FIRST PHASE WITH REDUCED AVERAGE TEMPERATURE OF THE REACTOR COOLING SYSTEM AND IN THE SECOND PHASE WITH POWER REDUCTION TO ABOUT 1% PER DAY. AUGUST - UNPLANNED EXTENSION OF REFUELLING OUTAGE CAUSED BY DELAY OF SPECIAL TOOLS TO GET IN BRASIL USED FOR TURBINE GENERATOR PARTIAL DISCHARGE AND OVERALL ISOLATION TESTS. OCTOBER - DISARM THE MAIN COOLING PUMP PAC20AP001 DUE TO HIGH TEMPERATURE ALARM IN A MOTOR WINDING PHASE (SENSOR FAILURE). NOVEMBER - REACTOR TRIP DUE TO LOSS OF 2 OF 4 REACTOR COOLANT PUMPS (JEB) BY ACTION OF THE GENERATOR IMPEDANCE RELAY.

### 4. 2014 Summary of Operation

UNIT 6 WAS OPERATED ON BASE LOAD MODE IN ACCORDANCE WITH THE LOAD SCHEDULE AGREED BY BULGARIAN TRANSMISSION SYSTEM OPERATOR (TSO), INCL. FUEL COAST DOWN MODE. THE PLANNED OUTAGE FOR ANNUAL MAINTENANCE ACTIVITIES AND REFUELLING WAS PERFORMED IN THE PERIOD 13 TH SEPTEMBER – 20 TH OCTOBER (TOTAL OUTAGE DURATION – 37 DAYS). THE PLANNED GENERATOR STATOR REPLACEMENT WAS NOT PERFORMED DUE TO THE STATOR DELIVERY DELAY CAUSED BY UNFAVOURABLE CONDITIONS TO SHIPPING TRANSPORTATION (DANUBE RIVER LOW LEVEL). IT IS ENFORCED REARRANGEMENT OF THE OPERATION MODE AND THE PLANNED OUTAGE PERIOD. IN 2014 THERE WERE NO ANY UNPLANNED REACTOR SCRAM OR SIGNIFICANT OPERATIONAL EVENTS RELATED TO THE SAFETY OR ENERGY LOSSES.

### 4. 2014 Summary of Operation

DURING THE REPORTING PERIOD PLANT ACHIEVED OPERATION FACTOR AND LOAD FACTOR AS 86.14% AND 83.35% RESPECTIVELY. PLANT WAS MANUALLY TRIPPED IN MARCH 2014 DUE TO SEVER SPARKING FROM CARBON BRUSHES ASSEMBLY OF MAIN GENERATOR ROTOR. PLANT FACED AN AUTO TRIP IN MAY DUE TO LOW CONDENSER VACUUM FOLLOWING TRIPPING OF COOLING WATER PUMPS UPON GRID LOSS. THREE TIMES PLANT TRIPPED WHILE CRITICAL BEFORE GRID CONNECTION (ONE TIME IN JUNE AND TWO TIMES IN JULY). PLANT FACED TWO AUTO TRIPS IN OCTOBER AND DECEMBER DUE TO LOSS OF OFFSITE POWER

## 4. 2014 Summary of Operation

MOCHOVCE 1 UNIT WAS OPERATED AT FULL POWER IN A BASE LOAD MODE IN 2014. UNIT PROVIDED GRID SUPPORTING SERVICES FOR LOAD FOLLOWING - FREQUENCY AND SECONDARY POWER CONTROL FOR GRID ADJUSTMENT AND TERTIARY POWER CONTROL. THERE WERE NO AUTOMATIC REACTOR SCRAMS DURING THE YEAR. UNPLANNED OUTAGES, OCCURED IN THE REPORTING PERIOD, CAUSED FORCED LOSSES OF 1.99 EFPD (1.56 OF THEM CAUSED BY EXTENDED GENERAL OVERHAUL). PLANNED ENERGY LOSSES OF 25.18 EFPD INCLUDED GENERAL OVERHAUL WITH REFUELING (19.00 EFPD), TG12 STATOR EXCHANGE (5.78 EFPD) AND THE REST WERE SCHEDULED TESTS AND RECERTIFICATION OF THE SUPPORTING SERVICES. OTHER FACTORS AFFECTING ENERGY GENERATION WERE LIMITATIONS DUE TO COAST-DOWN OPERATION AND ENVIRONMENTAL CONDITIONS (COOLING WATER TEMPERATURE LIMITS).

### 4. 2014 Summary of Operation

MOCHOVCE 2 UNIT WAS LARGELY OPERATED AT FULL POWER IN A BASE LOAD MODE IN 2014. UNIT PROVIDED GRID SUPPORTING SERVICES FOR LOAD FOLLOWING - FREQUENCY AND SECONDARY POWER CONTROL FOR GRID ADJUSTMENT AND TERTIARY POWER CONTROL. THROUGHOUT THE YEAR THERE WERE NO AUTOMATIC REACTOR SCRAMS AND NO UNPLANNED FULL OUTAGES. UNPLANNED POWER REDUCTIONS AND THE EXTENSION OF THE GENERAL OVERHAUL CAUSED FORCED LOSSES OF 6.79 EFPD. PLANNED ENERGY LOSSES OF 32.71 EFPD INCLUDED GENERAL OVERHAUL WITH REFUELING (32.00 EFPD), AND THE REST WERE SCHEDULED TESTS AND SUPPORTING SERVICES RECERTIFICATIONS. OTHER FACTORS AFFECTING ENERGY GENERATION WERE LIMITATIONS DUE COAST-DOWN OPERATION AND ENVIRONMENTAL CONDITIONS (COOLING WATER TEMPERATURE LIMITS).

### 4. 2014 Summary of Operation

SUMMARIZING: IN 2014 VANDELLOS II NPP PRODUCED 9193.624 GROSS GWH, SLIGHTLY LESS THAN EXPECTED GROSS 9216.210 GWH. THE MAIN CAUSES OF THIS DEVIATION ARE:- ON JANUARY 5TH AN AUTOMATIC REACTOR SCRAM OCCURRED DUE TO A LOSS OF 400KV LINE. AFTER SYNCHRONIZING AGAIN, ON 6TH FULL POWER LEVEL IS REACHED AND MAINTAINED UNTIL THE END OF THE MONTH. THE TOTAL OUTAGE WAS 32.566 GWH.- BETWEEN APRIL 2ND AND 5TH THE PLANT OPERATED AT 98% OF RTP DUE TO UNAVAILABILITY OF CALDON SYSTEM. THE TOTAL OUTAGE WAS 0.72 GWH.- BETWEEN MAY 11TH AND 13TH THE PLANT OPERATED AT 95% RTP DUE TO A MALFUNCTION ON VALVE LCV-AF54. THE TOTAL OUTAGE WAS 0.455 GWH.- ON JULY 25TH AN AUTOMATIC REACTOR SCRAM OCCURRED DUE TO LOSS OF THE 400 KV LINE. ON 26TH POWER ASCENSION BEGAN AND 100% POWER LEVEL WAS REACHED ON 27TH. FULL POWER WAS MAINTAINED UNTIL THE END OF THE MONTH. THE TOTAL OUTAGE WAS 39.566 GWH.- ON SEPTEMBER 18TH POWER WAS REDUCED TO TO 99.4% OF RTP DUE TO A MALFUNCTION IN A REHEATER 6B DISCHARGE VALVE. FULL LOAD IS RECOVERED THE NEXT DAY. THE TOTAL OUTAGE WAS 0.336 GWH.- ON OCTOBER 10TH AN AUTOMATIC REACTOR SCRAM OCCURRED DUE TO LOSS OF OFFSITE POWER OF 400 KV AND 220 KV. ONCE THE PROBLEM WAS SOLVED, FULL POWER OPERATION IS RECOVERED ON OCTOBER 13TH AND MAINTAINED UNTIL THE END OF THE MONTH. THE TOTAL OUTAGE WAS 69.838 GWH.- ON NOVEMBER 28TH A POWER REDUCTION WAS INITIATED DUE TO A MALFUNCTION ON THE LEVEL INDICATORS OF REFUELING WATER STORAGE TANK (BN-T01). AFTER THE PROBLEM WAS SOLVED, THE POWER REDUCTION WAS STOPPED AROUND 75% RTP POWER WAS RAISED AGAIN TO 100%. FULL POWER WAS MAINTAINED THE REST OF THE MONTH. THE TOTAL OUTAGE WAS 0.962 GWH. ALL THESE INCIDENTS RESULTED IN A LOAD FACTOR HAS PROVED TO BE OF 96.54%. THE NET PRODUCTION WAS 8824.89 GWH, SLIGHTLY LESS THAN EXPECTED, RESULTING IN A MEASURED/EXPECTED RATIO OF 99.75%.

### 4. 2014 Summary of Operation

FORMARK 1 HIGHLIGHTS:ANNUAL OUTAGE TOOK PLACE IN APRIL AND MAY AND INCLUDED IN TOTAL ABOUT 19 DAYS IN TIME. THERE WERE ABOUT 10 PLANT CHANGES PLANNED BUT NONE OF ANY HIGHLIGHT INTEREST.WORTH TO BE MENTIONED IS THAT BIG EFFORTS HAVE BEEN STARTED 2014 IN THE REORGANIZATION PROJECT. THE NEW ORGANIZATION IS PLANNED TO BE IN PLACE IN 2015. VATTENFALL WANTS TO MAKE THE TWO ORGANIZATIONS RINGHALS AND FORMARK MORE SIMILAR.AS A RESULT OF THE POST FUKUSHIMA PROJECT, SEVEN DIESELS HAVE ARRIVED TO THE SITE AND ARE NOW PLANNED FOR PERMANENT FINAL PLACING AND CONNECTION.

### 4. 2014 Summary of Operation

FORSMARK 2 HIGHLIGHTS:2014 WAS A SPECIAL YEAR FOR FORSMARK 2. THE TOTAL PRODUCED NET ENERGY OF THE YEAR WAS 8,7964 TWH THAT WAS ALL TIME HIGH! THE UNIT WAS IN TEMPORARY/TEST OPERATION OF 120% POWER AND WILL 2015 APPLY FOR THIS LEVEL OF POWER BY THE REGULATOR.ANNUAL OUTAGE WAS TAKING PLACE IN MAY AND JUNE AND INCLUDED IN TOTAL ABOUT 32 DAYS IN TIME. THERE WERE ABOUT 17 PLANT CHANGES PLANNED BUT NONE OF ANY HIGHLIGHT INTEREST.WORTH TO BE MENTIONED IS THAT BIG EFFORTS HAVE BEEN STARTED 2014 IN THE REORGANIZATION PROJECT. THE NEW ORGANIZATION IS PLANNED TO BE IN PLACE IN 2015. VATTENFALL WANTS TO MAKE THE TWO ORGANIZATIONS RINGHALS AND FORSMARK MORE SIMILAR.AS A RESULT OF THE POST FUKUSHIMA PROJECT, SEVEN DIESELS HAVE ARRIVED TO THE SITE AND ARE NOW PLANNED FOR PERMANENT FINAL PLACING AND CONNECTION.

### 4. 2014 Summary of Operation

FORSMARK 3 HIGHLIGHTS: THE ANNUAL OUTAGE TOOK PLACE IN JULY AND SEPTEMBER, AND IN TOTAL INCLUDED ABOUT 54.5 DAYS IN TIME. THE LARGEST ACTIVITIES THAT WERE CARRIED OUT ON THE REACTOR SIDE WERE: -EXCHANGE OF ELECTRICAL PENETRATIONS IN DIVISION A AND C IN THE LOWER REACTOR CONTAINMENT. -EXCHANGE TWO SWEEPOLET TO FORGED ONES IN THE FEED WATER SYSTEM, AND ALSO TWO CONNECTIONS TO RHR WITH THE SYSTEM 321 WERE EXCHANGED. THIS TO FACILITATE EASIER FUTURE INSPECTION OF WELDS. -IMPROVED RHR CAPACITY IN DIVISION A- SUB FOR BETTER MARGINS (BY INSERTING CLAMP FILTER AND NEW HEAT EXCHANGER. THE MAJOR MAINTENANCE MEASURES CARRIED OUT ON REACTOR SIDE WERE A REVIEW ON THREE OF THE MAIN CIRCULATIONS PUMPS, EXCHANGE OF 11OF THE ELECTRIC FINE MOTION CONTROL ROD DRIVES (FMCRD) AND THE PLANNED 10-YEAR PERIODIC INSPECTION ON THE REACTOR VESSEL. ON TURBINE SIDE FOLLOWING MAIN ACTIVITIES WERE CARRIED OUT: -EXCHANGE OF HIGH PRESSURE TURBINE WAS THE LARGEST ACTIVITY. -ON THE TURBINE SIDE THERE WAS ALSO A CONTROL OF LOW- PRESSURE TURBINES AND FIXING/REPAIR OF CONCRETE IN COOLING CHANNELS. -WORK WAS ALSO CARRIED OUT TO, IN A LONG TERM PERSPECTIVE, BE ABLE TO INTRODUCE A DIVERSIFICATION TO THE FOUR REGULAR RHR DIVISIONS BY ORDER TO CONNECT EXTERNAL COOLING FACILITY. -DURING THE OUTAGE THERE WERE A TOTAL OF 4778 WORK ORDERS HANDLED. AND A TOTAL OF ABOUT 2100 PERSONS HAVE BEEN INVOLVED IN THE ANNUAL OUTAGE ACTIVITIES.

### 4. 2014 Summary of Operation

DURING ANNUAL OUTAGE WITH REFUELLING PROJECT MILK WAS CARRIED OUT. REASON FOR THE PROJECT IS TO REACH THE NEW ENVIRONMENTAL REQUIREMENTS FROM THE SWEDISH AUTHORITY. A LARGE NUMBER OF COMPONENTS IN DIFFERENT PROCESS SYSTEM WERE EXCHANGED DURING THIS OUTAGE. MOST COMPREHENSIVE ACTIONS WAS IN THE REACTOR CONTAINMENT WHERE ALL THE ELECTRICAL PENETRATION AND 1500 CABLES WERE EXCHANGED. CABLES, COMPONENTS AND CABINET WERE PREFABRICATED TO REDUCE THE SCHEDULE FOR THE INSTALLATION PHASE.

### 4. 2014 Summary of Operation

ALSO THE 42ND YEAR OF THE PLANT WAS AN UNDISTURBED OPERATION YEAR. THANKS TO CONTINUOUS IMPROVEMENTS IN THE SAFETY AND PERFORMANCE OF THE PLANT SYSTEMS, THE NPP PRODUCED 3155 GWH AND ACHIEVED THE NEW PLANT PRODUCTION RECORD. THE PLANT SUPPLIED SAFE AND CLEAN ELECTRICITY INTO THE GRID FOR 8'146 HOURS. IN ORDER TO PRESERVE THE GRID STABILITY, IT WAS REQUESTED BY THE CONTROL CENTER OF SWISS GRID TO REDUCE THE POWER OUTPUT OF THE PLANT NINE TIMES. THE GRID INSTABILITIES BEING DUE TO THE IRREGULAR SUPPLIES OF RENEWABLE ENERGIES. ON AUGUST 10, BEGAN THE ANNUAL PLANT OUTAGE WHICH LASTED XX DAYS. THE MAIN FOCUS OF THIS ANNUAL OUTAGE WERE RIGOROUS INSPECTIONS AND ACCURATE TESTS OF: THE REACTOR PRESSURE VESSEL (RPV), SECURITY SYSTEMS, ELECTRICAL PROTECTION/CONTROL SYSTEMS, AND THE PERFORMANCE OF KEY COMPONENTS. FOLLOWING OUR PREVENTIVE MAINTENANCE POLICY, AIMING TO PRESERVE THE PLANT'S SYSTEMS AT THE STATE-OF-THE-ART, THE PLANT CREW REPLACED 6 OUT OF 57 CONTROL ROD DRIVES.
