# IAEA NUCLEAR ENERGY SERIES PUBLICATIONS

## STRUCTURE OF THE IAEA NUCLEAR ENERGY SERIES

Under the terms of Articles III.A.3 and VIII.C of its Statute, the IAEA is authorized to “foster the exchange of scientific and technical information on the peaceful uses of atomic energy”. The publications in the **IAEA Nuclear Energy Series** present good practices and advances in technology, as well as practical examples and experience in the areas of nuclear reactors, the nuclear fuel cycle, radioactive waste management and decommissioning, and on general issues relevant to nuclear energy. The **IAEA Nuclear Energy Series** is structured into four levels:

- (1) The **Nuclear Energy Basic Principles** publication describes the rationale and vision for the peaceful uses of nuclear energy.
- (2) **Nuclear Energy Series Objectives** publications describe what needs to be considered and the specific goals to be achieved in the subject areas at different stages of implementation.
- (3) **Nuclear Energy Series Guides and Methodologies** provide high level guidance or methods on how to achieve the objectives related to the various topics and areas involving the peaceful uses of nuclear energy.
- (4) **Nuclear Energy Series Technical Reports** provide additional, more detailed information on activities relating to topics explored in the **IAEA Nuclear Energy Series**.

The IAEA Nuclear Energy Series publications are coded as follows: **NG** – nuclear energy general; **NR** – nuclear reactors (formerly **NP** – nuclear power); **NF** – nuclear fuel cycle; **NW** – radioactive waste management and decommissioning. In addition, the publications are available in English on the IAEA web site:

[www.iaea.org/publications](http://www.iaea.org/publications)

For further information, please contact the IAEA at Vienna International Centre, PO Box 100, 1400 Vienna, Austria.

All users of the IAEA Nuclear Energy Series publications are invited to inform the IAEA of their experience for the purpose of ensuring that they continue to meet user needs. Information may be provided via the IAEA web site, by post, or by email to [Official.Mail@iaea.org](mailto:Official.Mail@iaea.org).

INITIATING NUCLEAR POWER  
PROGRAMMES: RESPONSIBILITIES AND  
CAPABILITIES OF OWNERS AND  
OPERATORS

The following States are Members of the International Atomic Energy Agency:

AFGHANISTAN	GERMANY	PAKISTAN
ALBANIA	GHANA	PALAU
ALGERIA	GREECE	PANAMA
ANGOLA	GRENADA	PAPUA NEW GUINEA
ANTIGUA AND BARBUDA	GUATEMALA	PARAGUAY
ARGENTINA	GUYANA	PERU
ARMENIA	HAITI	PHILIPPINES
AUSTRALIA	HOLY SEE	POLAND
AUSTRIA	HONDURAS	PORTUGAL
AZERBAIJAN	HUNGARY	QATAR
BAHAMAS	ICELAND	REPUBLIC OF MOLDOVA
BAHRAIN	INDIA	ROMANIA
BANGLADESH	INDONESIA	RUSSIAN FEDERATION
BARBADOS	IRAN, ISLAMIC REPUBLIC OF	RWANDA
BELARUS	IRAQ	SAINT LUCIA
BELGIUM	IRELAND	SAINT VINCENT AND THE GRENADINES
BELIZE	ISRAEL	SAN MARINO
BENIN	ITALY	SAUDI ARABIA
BOLIVIA, PLURINATIONAL STATE OF	JAMAICA	SENEGAL
BOSNIA AND HERZEGOVINA	JAPAN	SERBIA
BOTSWANA	JORDAN	SEYCHELLES
BRAZIL	KAZAKHSTAN	SIERRA LEONE
BRUNEI DARUSSALAM	KENYA	SINGAPORE
BULGARIA	KOREA, REPUBLIC OF	SLOVAKIA
BURKINA FASO	KUWAIT	SLOVENIA
BURUNDI	KYRGYZSTAN	SOUTH AFRICA
CAMBODIA	LAO PEOPLE'S DEMOCRATIC REPUBLIC	SPAIN
CAMEROON	LATVIA	SRI LANKA
CANADA	LEBANON	SUDAN
CENTRAL AFRICAN REPUBLIC	LESOTHO	SWEDEN
CHAD	LIBERIA	SWITZERLAND
CHILE	LIBYA	SYRIAN ARAB REPUBLIC
CHINA	LIECHTENSTEIN	TAJIKISTAN
COLOMBIA	LITHUANIA	THAILAND
CONGO	LUXEMBOURG	TOGO
COSTA RICA	MADAGASCAR	TRINIDAD AND TOBAGO
CÔTE D'IVOIRE	MALAWI	TUNISIA
CROATIA	MALAYSIA	TURKEY
CUBA	MALI	TURKMENISTAN
CYPRUS	MALTA	UGANDA
CZECH REPUBLIC	MARSHALL ISLANDS	UKRAINE
DEMOCRATIC REPUBLIC OF THE CONGO	MAURITANIA	UNITED ARAB EMIRATES
DENMARK	MAURITIUS	UNITED KINGDOM OF GREAT BRITAIN AND NORTHERN IRELAND
DJIBOUTI	MEXICO	UNITED REPUBLIC OF TANZANIA
DOMINICA	MONACO	UNITED STATES OF AMERICA
DOMINICAN REPUBLIC	MONGOLIA	URUGUAY
ECUADOR	MONTENEGRO	UZBEKISTAN
EGYPT	MOROCCO	VANUATU
EL SALVADOR	MOZAMBIQUE	VENEZUELA, BOLIVARIAN REPUBLIC OF
ERITREA	MYANMAR	VIET NAM
ESTONIA	NAMIBIA	YEMEN
ESWATINI	NEPAL	ZAMBIA
ETHIOPIA	NETHERLANDS	ZIMBABWE
FIJI	NEW ZEALAND	
FINLAND	NICARAGUA	
FRANCE	NIGER	
GABON	NIGERIA	
GEORGIA	NORTH MACEDONIA	
	NORWAY	
	OMAN	

The Agency's Statute was approved on 23 October 1956 by the Conference on the Statute of the IAEA held at United Nations Headquarters, New York; it entered into force on 29 July 1957. The Headquarters of the Agency are situated in Vienna. Its principal objective is "to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world".

## IAEA Library Cataloguing in Publication Data

Names: International Atomic Energy Agency.

Title: Initiating nuclear power programmes: responsibilities and capabilities of owners and operators / International Atomic Energy Agency.

Description: Vienna : International Atomic Energy Agency, 2020. | Series: IAEA nuclear energy series, ISSN 1995-7807 ; no. NG-T-3.1 (Rev. 1) | Includes bibliographical references.

Identifiers: IAEAL 20-01289 | ISBN 978-92-0-104619-2 (paperback : alk. paper) | 978-92-0-164119-9 (pdf)

Subjects: LCSH: Nuclear power plants. | Nuclear power plant operators. | Nuclear power plants — Commissioning.

Classification: UDC 621.039.5 | STI/PUB/1867

# FOREWORD

One of the IAEA's statutory objectives is to "seek to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world." One way this objective is achieved is through the publication of a range of technical series. Two of these are the IAEA Nuclear Energy Series and the IAEA Safety Standards Series.

According to Article III.A.6 of the IAEA Statute, the safety standards establish "standards of safety for protection of health and minimization of danger to life and property". The safety standards include the Safety Fundamentals, Safety Requirements and Safety Guides. These standards are written primarily in a regulatory style and are binding on the IAEA for its own programmes. The principal users are the regulatory bodies in Member States and other national authorities.

The IAEA Nuclear Energy Series comprises reports designed to encourage and assist R&D on, and application of, nuclear energy for peaceful uses. This includes practical examples to be used by owners and operators of utilities in Member States, implementing organizations, academia, and government officials, among others. This information is presented in guides, reports on technology status and advances, and best practices for peaceful uses of nuclear energy based on inputs from international experts. The IAEA Nuclear Energy Series complements the IAEA Safety Standards Series.

An appropriate infrastructure is essential for the safe, secure, peaceful and sustainable use of nuclear power. Member States introducing nuclear power face the challenge of building the necessary infrastructure for the first nuclear power plant. The IAEA supports these Member States through technical assistance, missions and workshops, and with new and updated technical publications.

IAEA Nuclear Energy Series No. NG-G-3.1 (Rev. 1), Milestones in the Development of a National Infrastructure for Nuclear Power, first issued in 2007 and updated in 2015, defines three milestones in the development of infrastructure and provides detailed guidance for 19 specific infrastructure issues ranging from a government's national position on nuclear power to the procurement of items and services for the first nuclear power plant. The guidance in that publication is referred to here as 'the Milestones approach'.

The development of the infrastructure for a nuclear power programme includes the establishment of policies and strategies in areas such as human resource development, nuclear fuel cycle and waste management, industrial involvement and nuclear safety. A legal and regulatory framework that creates an environment enabling the project to be implemented in a transparent and effective manner will also need to be established. The elements of this infrastructure will have an impact on the project and will guide the discussions of the future owner/operator with potential vendors. In this regard, it is important that the owner/operator, if already identified, participate in this process from the beginning.

As the programme evolves, it is necessary to conduct a feasibility study, evaluate different technologies and identify the preferred ones, prepare a financial plan and, finally, procure the nuclear power plant. These are responsibilities of the owner/operator in Phase 2. After the procurement of the nuclear power plant, the owner/operator will apply for the required licences, oversee construction and prepare for operation. These activities take place in Phase 3.

This publication is a revision of the 2009 version of NG-T-3.1. It provides guidance on the establishment and development of the owner/operator so that it can discharge its responsibilities throughout the phases of the programme.

The IAEA is grateful to all who contributed to the drafting and review of this publication. The IAEA officer responsible for this publication was B. Lepouzé of the Division of Nuclear Power.

#### *EDITORIAL NOTE*

*This publication has been edited by the editorial staff of the IAEA to the extent considered necessary for the reader's assistance. It does not address questions of responsibility, legal or otherwise, for acts or omissions on the part of any person.*

*Although great care has been taken to maintain the accuracy of information contained in this publication, neither the IAEA nor its Member States assume any responsibility for consequences which may arise from its use.*

*Guidance provided here, describing good practices, represents expert opinion but does not constitute recommendations made on the basis of a consensus of Member States.*

*The use of particular designations of countries or territories does not imply any judgement by the publisher, the IAEA, as to the legal status of such countries or territories, of their authorities and institutions or of the delimitation of their boundaries.*

*The mention of names of specific companies or products (whether or not indicated as registered) does not imply any intention to infringe proprietary rights, nor should it be construed as an endorsement or recommendation on the part of the IAEA.*

*The IAEA has no responsibility for the persistence or accuracy of URLs for external or third party Internet web sites referred to in this book and does not guarantee that any content on such web sites is, or will remain, accurate or appropriate.*

# 1. INTRODUCTION

## 1.1. BACKGROUND

The introduction of nuclear power in a country requires the development of the institutional, human and physical infrastructure that will support the nuclear power programme throughout its life cycle. A number of organizations will be involved in the programme, each with particular responsibilities and capabilities. The IAEA publication *Milestones in the Development of a National Infrastructure for Nuclear Power* [1] (hereafter ‘the Milestones approach’) describes the role of the three key organizations:

- The government<sup>1</sup>;
- The regulatory body;
- The owner/operator of the nuclear power plant.

The Milestones approach [1] has been widely adopted by countries embarking on a new nuclear power programme as well as by countries expanding their existing programmes after a long period without new constructions. It describes a set of infrastructure issues to be addressed during three distinct phases in the development of the infrastructure for a nuclear power programme, each punctuated by a milestone (see Fig. 1).

The three phases are [1]:

- Phase 1: Considerations before a decision to launch a nuclear power programme is taken.
- Phase 2: Preparatory work for the contracting and construction of a nuclear power plant after a policy decision has been taken.
- Phase 3: Activities to implement the first nuclear power plant.

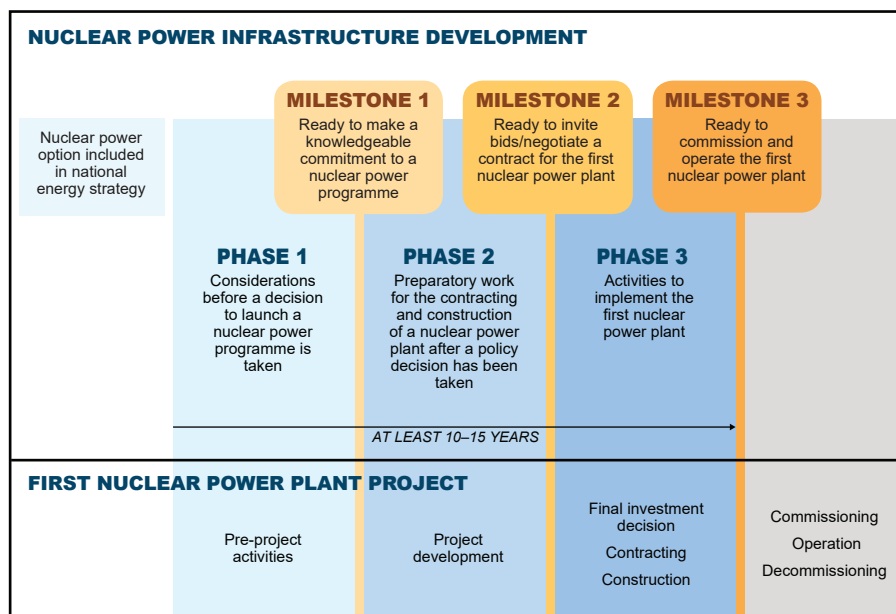

FIG. 1. Development of the infrastructure for a national nuclear power programme.

<sup>1</sup> The government mechanism responsible for coordinating the work of the organizations involved in nuclear power infrastructure development is referred to as the nuclear energy programme implementing organization (NEPIO). Its responsibilities and functions are described in Ref. [2].

The three milestones are [1]:

- Milestone 1 (at the end of Phase 1): Ready to make a knowledgeable commitment to a nuclear power programme.
- Milestone 2 (at the end of Phase 2): Ready to invite bids/negotiate a contract for the first nuclear power plant.
- Milestone 3 (at the end of Phase 3): Ready to commission and operate the first nuclear power plant.

Each organization has a specific role to play, with responsibilities that change as the programme advances. The NEPIO is responsible for the overall coordination of the programme and ensures the engagement of all important parties. The regulatory body is responsible to make independent regulatory decisions that are free from any undue influences, such as pressures associated with changing political circumstances or economic conditions. The owner/operator is responsible for selecting the technology, preparing and assessing the bid (if using competitive bidding), negotiating the contract(s) and managing the nuclear power plant project, including applying for the licences required for construction and operation.

This publication assumes that the same organization will own and operate the nuclear power plant, hence the term ‘owner/operator’. The less frequent case where the owner and the operator are separate entities is discussed in Section 3.3. Similarly, this publication assumes that the owner/operator will procure a plant through an engineering–procurement–construction (EPC) contract, also called a turnkey contract (see Section 3.2 for a description of the impact of other contracting approaches).

## 1.2. OBJECTIVE

This publication provides guidance on the main activities to be undertaken by the owner/operator during Phases 2 and 3 of nuclear power infrastructure development. Member States can use this information to ensure that the responsibilities and capabilities of the owner/operator are understood by all nuclear power programme stakeholders and that the owner/operator develops effectively in line with the project schedule.

## 1.3. SCOPE

This publication describes the responsibilities and capabilities of the owner/operator during Phases 2 and 3 of nuclear power infrastructure development and provides guidance on developing the required competencies for the organization. It also discusses the management of the interfaces between the owner/operator and other stakeholders. It does not explicitly address Phase 1, as it is assumed that the owner/operator is designated early in Phase 2. Guidance provided here, describing good practice, represents expert opinion but does not constitute recommendations made on the basis of a consensus of Member States.

## 1.4. STRUCTURE

The structure of this publication comprises six sections, including this introduction. Section 2 lists the desired attributes that an owner/operator should develop over the course of the programme. Section 3 describes typical organizational structures for an owner/operator organization following a variety of contracting approaches. Section 4 outlines the main responsibilities of the owner/operator in Phases 2 and 3. Section 5 describes the evolving nature of the owner/operator during the implementation of the programme and suggests some approaches to develop competence. Section 6 describes the interfaces that the owner/operator needs to manage with its main stakeholders.

## 1.5. USERS

This publication is intended to be used by decision makers, owner/operator executives and staff as well as others in organizations involved in the nuclear power programme. It may also be useful to countries expanding their nuclear power programmes after long periods without new projects.

## 2. DESIRED ATTRIBUTES OF AN OWNER/OPERATOR

The owner/operator is expected to perform key activities during Phases 2 and 3 of nuclear power infrastructure development, some of which are presented in Fig. 2.

No activities are shown in Phase 1 since the Milestones approach [1] assumes that the owner/operator is designated early in Phase 2. However, if prospective leaders of the owner/operator are identified in Phase 1, it is advisable that they participate in the development of the policies and strategies for the nuclear power programme, as these will have an impact on the owner/operator organization. These policies and strategies will also frame the discussions and negotiations with potential vendors and will influence the project activities and the licensing process in Phase 3.

In Phase 2, the focus of the owner/operator is on establishing and developing the organization itself and carrying out siting activities to support the preparation of documents necessary for the environmental impact assessment and the site licence application. During Phase 2, the owner/operator also needs to develop its understanding of commercially available nuclear power technologies and to establish technical specifications for the nuclear power plant to be included in the bid invitation or to guide negotiations with a preferred vendor.

At the beginning of Phase 3, the focus of the owner/operator is on contract negotiations and taking the final investment decision. Later in Phase 3, however, the focus will shift to preparing a construction licence application, overseeing construction activities, preparing an operating licence application and preparing for commissioning and plant operation (see Section 4 for a detailed list of the responsibilities of the owner/operator in Phases 2 and 3).

As the owner/operator evolves from a project development organization in Phase 2 to a construction and commissioning organization in Phase 3, the needs both in terms of staffing and competencies will change. However, several common attributes are necessary to support the project throughout both phases.

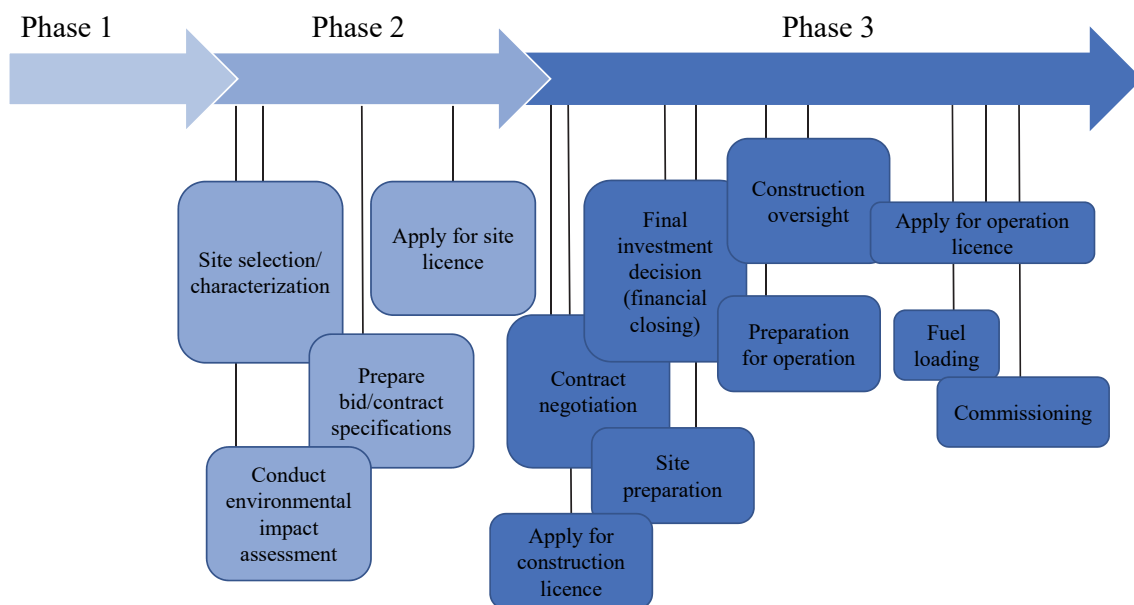

FIG. 2. Main milestones for an owner/operator in a nuclear power programme.

## 2.1. STRONG LEADERSHIP THAT LEADS TO AN APPROPRIATE ORGANIZATIONAL CULTURE

Since the owner/operator has prime responsibility for the safety and security of the nuclear power plant, it should develop an organizational culture that promotes the appropriate attitudes, values, standards, morals and norms of acceptable behaviour that are necessary in a nuclear facility.

Managers influence the organizational culture through their leadership and actions. Through their behaviour, managers demonstrate their commitment to nuclear safety and security. Their leadership should empower employees throughout the organization so that emerging problems can be identified and solved by employees internally at an early stage. Managers should encourage the reporting of potential safety or security concerns, near misses and incidents. The management should also provide responses to valid concerns without delay. More details can be found in IAEA Safety Standards Series No. GS-G-3.1, Application of the Management System for Facilities and Activities [3]. As stated in para. 3.12 of IAEA Safety Standards Series No. SF-1, Fundamental Safety Principles [4], “Leadership in safety matters has to be demonstrated at the highest levels in an organization.” Strong leadership is also important for effective and economical operation of the nuclear power plant.

The IAEA safety standards require an organization with responsibility for nuclear safety to establish and maintain a management system that fosters a strong safety culture. IAEA Safety Standards Series No. GSR Part 2, Leadership and Management for Safety [5], emphasizes the importance of leadership in achieving this. In the same way, the Nuclear Security Fundamentals (see paras 3.3(h) and 3.12(b) of Ref. [6]) state “that prime responsibility for the security of *nuclear material, other radioactive material, associated facilities, associated activities, sensitive information* and *sensitive information assets* rests with the *authorized persons*” (i.e. owner/operator), who contribute by “demonstrating leadership in nuclear security matters at the highest levels”.

IAEA Nuclear Security Series No. 7, Nuclear Security Culture [7], states that an “effective nuclear security culture can result in a significant increase in the effectiveness of the security of radioactive material and associated facilities and transport.” Paragraph 2.4 of Ref. [7] states that “nuclear security culture refers to the personal dedication and accountability and understanding of all individuals engaged in any activity which has a bearing on the security of nuclear activities.”

Finally, Ref. [8] notes that the owner/operator should also establish procedures to carry out functions necessary to account for and control nuclear material and prepare reports for submission to the regulatory body.

## 2.2. ABILITY TO MANAGE GROWTH AND CHANGE

The owner/operator will start as a core group of decision makers, managers and experts brought together to start the first nuclear power plant project. As the project progresses, the owner/operator organization will grow in size, changing the group dynamics. This process is described in Section 5.

The management system developed for the organization should support the changes in size and scope. There will be a need to establish new processes or update existing ones as the organization’s functions and responsibilities evolve. An effective way to manage growth and change is to perform self-assessments at key stages in the project to ensure that the organization is ready for the next step. Self-assessments are designed to identify process weaknesses and obstacles to achieving performance objectives. Self-assessments require open communication and full involvement of the management of the organization. Independent assessments, carried out by independent audit teams internal or external to the organization, can effectively complement regular self-assessments. Guidance on self-assessments and independent assessments is provided in GS-G-3.1 [3].

## 2.3. EFFECTIVE INTERNAL AND EXTERNAL COMMUNICATION

The owner/operator should establish clear lines and procedures for internal communication and reporting. Communications should be clear and concise, and the procedures should cover both the provision of correct and complete information and the receipt and dissemination of information. The owner/operator will also need to communicate with a wide range of stakeholders connected with the implementation of the nuclear power programme, in particular with the vendor organization and the regulatory body. The necessary interfaces and communications with external organizations are discussed in Section 6.

## 2.4. TECHNICAL AND COMMERCIAL COMPETENCE

It is important for the owner/operator to have the expertise needed to manage the nuclear power plant project and to make decisions in an informed manner. The technical expertise needed by the owner/operator will vary as the focus of the project evolves from project development to contracting to construction and finally to operation.

It is likely that external support will be needed for some activities to be conducted by the owner/operator, mainly in the early phases of the project, as expertise may not be available in the country. This is particularly true for some specific activities involving areas such as nuclear safety and security, radiation protection, and waste management. Even without the full set of competencies available to perform these activities, the owner/operator should have sufficient knowledge to specify the work to be outsourced as well as to understand the results presented by the subcontractors. This level of knowledge is required to be a ‘knowledgeable customer’ and this concept is presented in further detail in Section 5.3.

Competence in contracting and procurement is equally important, as the owner/operator will have to procure goods and services from the very beginning of the project and will have to ensure their quality while controlling costs. These contract management skills will be useful during the construction of the plant and later during operation.

# 3. OWNER/OPERATOR ORGANIZATIONAL STRUCTURES

## 3.1. GOVERNMENTAL STRATEGY

As defined in Ref. [9], the “national position is the outcome of a process that establishes the governmental strategy and commitment to develop, implement and maintain a safe, secure and sustainable nuclear power programme.” The governmental strategy defines the main objectives of the programme. It further identifies preferable options for the nuclear power programme, identifies potential infrastructure gaps and provides recommendations to address those gaps should the State decide to proceed [9].

The owner/operator and the regulatory body are the main implementers of the governmental strategy, and their development and actions will be driven by the agreed strategy. Elements of the governmental strategy that will impact the structure and actions of the owner/operator include the following:

- Size of the nuclear power programme;
- Timescale for the programme;
- Preferable reactor technologies;
- Contracting approach;
- Options for financing the project;
- Fuel cycle and waste management options;
- Considerations on human resource development;
- Considerations on national industrial involvement.

## 3.2. IMPACT OF THE CONTRACTING APPROACH ON THE ORGANIZATIONAL STRUCTURE

Notwithstanding the governmental strategy, the number of technical staff that the owner/operator needs during Phases 2 and 3 depends on the contracting strategy selected for the construction of the nuclear power plant. Embarking and expanding countries have considered and adopted several contracting structures for nuclear power plant construction, of which the three most common approaches are turnkey (EPC), split package and build–own–operate (BOO).

### 3.2.1. Typical structure of the owner/operator in the turnkey approach

In the turnkey approach, the owner/operator procures the nuclear power plant through a single contract that covers the entire plant construction. Most embarking countries select this approach for their first nuclear power plant. Figure 3 shows the typical structure of an EPC contract where several organizations are involved in the purchase, construction and commissioning of a nuclear power plant.

In a turnkey contract, the owner/operator is responsible for overseeing the implementation of the contract signed with the vendor (EPC contractor). This activity requires expert knowledge in different areas, and the owner/operator may need support from a technical support organization (TSO), which will play the role of an owner's engineer.

When the procurement of a nuclear power plant is performed through a turnkey contract, the engineering and procurement of components and services, as well as the construction of the plant is the responsibility of the EPC contractor. This contractor is expected to have experience in design as well as in operation and the engineering functions include:

- Adapting the plant design to the requirements of the owner/operator and to the specific site conditions;
- Managing procurement;
- Managing construction;
- Managing the schedule and the interface between the various suppliers;
- Training the future owner/operator.

The team within the EPC contractor responsible for adapting the design, preparing the corresponding documentation and maintaining the plant configuration control during construction and commissioning is sometimes called the architect-engineer. Under an EPC contract, the management of the supply chain during construction is under the responsibility of the EPC contractor and the owner/operator has to ensure that proper controls are applied.

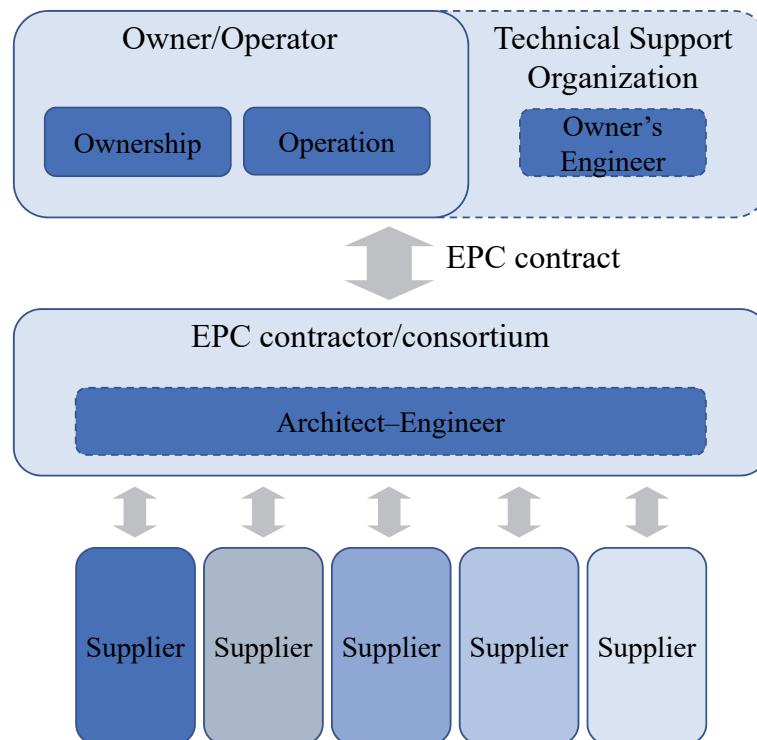

FIG. 3. Main organizations in the construction of a nuclear power plant through an engineering–procurement–construction contract.

### 3.2.2. Typical structure of the owner/operator in the split package approach

Some expanding countries have adopted the split package approach, in which the procurement of the nuclear power plant is divided into several allotments and the owner/operator is responsible for the engineering, procurement, construction and management of the overall project. The main difference from a turnkey project is that the owner/operator manages rather than monitors the different contracts and their interfaces, including the supply chain, and plays the role of the architect–engineer (see Fig. 4).

The owner/operator has to discharge the architect–engineer functions and may need the support of a TSO for this purpose. This approach is appropriate for countries looking to build a fleet of nuclear power plants of similar design or to achieve technological independence. It requires a higher level of competence and is more appropriate for an experienced owner/operator.

### 3.2.3. Build–own–operate approach

In the less common BOO approach, the host government grants the developer the right to finance, build, own and operate a facility for which it will keep the associated revenues and bear the associated risks. The host government typically offers a power purchase agreement for a certain period to give visibility on the return on investment to the project developer. A variant of BOO is build–own–operate–transfer (BOOT), in which the assets are transferred to the host government or a designated entity after a defined period of time of operation.

As in the other schemes, the host government is responsible for the establishment of the national infrastructure for nuclear power. This includes the national commitment to the programme, including stakeholder involvement, establishment of the legal and regulatory frameworks and development of the necessary policies and strategies for safety, security, safeguards, emergency preparedness and response, spent fuel and nuclear waste management, and decommissioning.

## 3.3. SEPARATE OWNER AND OPERATING ORGANIZATION

In the Milestones approach [1], there is no distinction between the owner of the assets and the operator of the nuclear power plant, as the common approach in operating countries is to have an organization that owns and operates the facility. However, there are instances in embarking countries where the owner and the operating

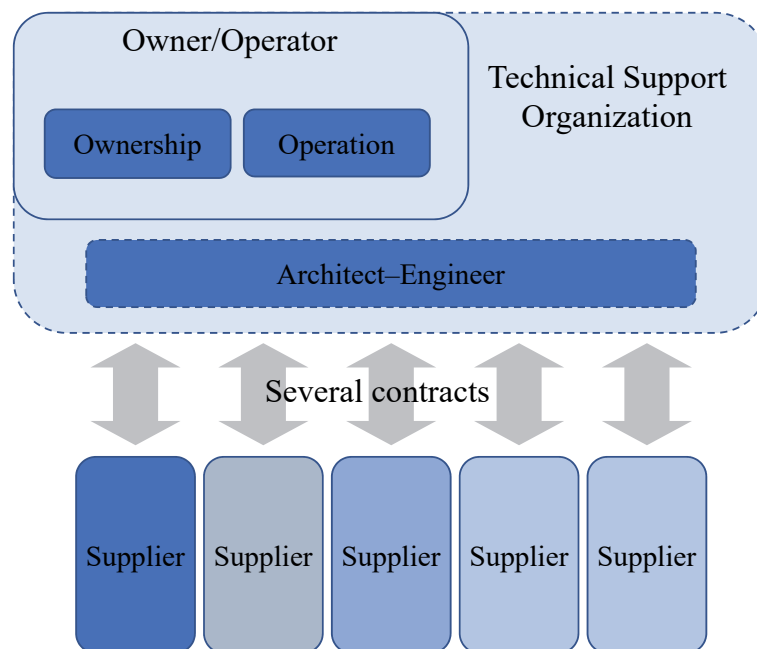

FIG. 4. Organizational structure in the split package approach.

organization are two different entities with distinct roles and responsibilities. These types of arrangement are usually considered to allow the embarking country to gain from the expertise of an experienced nuclear operator by establishing a joint venture while retaining the full ownership of the nuclear power plant.

While the owner organization benefits from the revenue of electricity sales, it needs to provide the operator with enough resources for the safe operation of the nuclear power plant as well as funding for decommissioning and radioactive waste management. It should also service any outstanding debt and distribute dividends to its shareholders.

The operator of the plant, which as the licensee bears the prime responsibility for safety and security, should prepare and discuss the budget with the owner to obtain the necessary financial support. It is therefore important that the relationship between the two entities be clearly defined in the contract. The owner will need to have a sufficient understanding of nuclear power and of the licence requirements of the operating organization to manage the contract.

## **4. ROLE OF THE OWNER/OPERATOR IN THE NUCLEAR POWER PROGRAMME**

The owner/operator is the project developer in Phase 2. It owns the assets of the nuclear power plant and will eventually benefit from the income from the sale of the electricity generated. In Phase 3, the owner/operator is responsible for submitting licence applications, overseeing construction and preparing for commissioning and future operation. The owner/operator has the overall responsibility for safety and security as it evolves from a project developer to an operating organization (see Section 5.2 for more detail).

### **4.1. ROLE OF THE OWNER/OPERATOR IN PHASE 2**

Following the country's commitment to proceed with the development of the nuclear power programme, the owner/operator is designated. The owner/operator initiates the development of the organization and begins to develop the competencies necessary to support the activities to be conducted late in Phase 2 and in Phase 3.

Table 1 identifies the main activities to be conducted by the owner/operator in Phase 2, which are organized by infrastructure issues as in the Milestones approach [1]. They are not in chronological order, as several of them can be conducted in parallel depending on the resources available. Additional guidance on the scope of activities can be found in the references provided.

### **4.2. ROLE OF THE OWNER/OPERATOR IN PHASE 3**

In Phase 3, the owner/operator will evaluate the bids (if competitive bidding is used), negotiate the contract(s), and manage the nuclear power plant project. This will include applying for the required licences and overseeing the construction. Later in Phase 3, the owner/operator will prepare for commissioning and operation.

Table 2 identifies the main activities to be conducted by the owner/operator in Phase 3, organized by infrastructure issues as in the Milestones approach [1]. They are not in chronological order as several of them may be conducted in parallel depending on the resources available. Reference material that provides additional guidance on the scope of activities are also identified.

TABLE 1. MAIN ACTIVITIES OF THE OWNER/OPERATOR IN PHASE 2

Issue	Activity	Refs
1. National position	Decide with the government on the strategy for developing contract arrangements for the nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.1.2 NG-T-3.6 (Rev. 1) [2]
2. Nuclear safety	Participate in the global nuclear safety framework	SSG-16 [10], Action 14
	Strengthen cooperation on safety related matters with States with advanced nuclear power programmes	SSG-16 [10], Action 16
	Establish contact with organizations in other States and international organizations to seek advice on safety related matters	SSG-16 [10], Action 13
	Develop the expertise to prepare for the conduct or the review of safety assessments	SSG-16 [10], Action 118
	Develop an in-depth understanding of the safety principles and safety requirements applicable in the design of a nuclear power plant	SSG-16 [10], Action 172
3. Management	Define an organizational structure and recruit appropriate staff	NG-G-3.1 (Rev. 1) [1], section 3.3.2
	Establish a management system that promotes a strong safety culture	NG-G-3.1 (Rev. 1) [1], section 3.3.2 SSG-16 [10], Actions 75–77 GSR Part 2 [5]
	Assess alternative technologies to determine which are most appropriate or preferred	NG-G-3.1 (Rev. 1) [1], section 3.3.2 NP-T-1.10 [11]
	Establish BISs and evaluation criteria	NG-G-3.1 (Rev. 1) [1], section 3.3.2 NG-T-3.9 [12]
	Build project management capabilities and a competent procurement team	NG-G-3.1 (Rev. 1) [1], section 3.3.2
	Establish working relationships with the regulatory body	NG-G-3.1 (Rev. 1) [1], section 3.3.2
	Institute procedures to ensure that knowledge critical to safe and secure operation will always be preserved	NG-G-3.1 (Rev. 1) [1], section 3.3.2
4. Funding and financing	<p>Work with the government to develop a funding plan for the following activities:</p> <ul style="list-style-type: none"> <li>— Establishment of the regulatory framework</li> <li>— Regulatory body</li> <li>— Government stakeholder involvement programme</li> <li>— Siting and environment protection activities that lie with the government</li> <li>— Emergency preparedness and response</li> <li>— Education, training and research</li> <li>— Any required improvements to the national grid</li> <li>— Incentives to promote localization</li> <li>— Storage and disposal of radioactive waste including spent fuel</li> <li>— Decommissioning</li> </ul>	NG-G-3.1 (Rev. 1) [1], section 3.4.2

TABLE 1. MAIN ACTIVITIES OF THE OWNER/OPERATOR IN PHASE 2 (cont.)

Issue	Activity	Refs
	Establish a financing plan for the nuclear power plant project along with a strategy to manage the financial risks	NG-G-3.1 (Rev. 1) [1], section 3.4.2 NG-T-4.2 [13] NG-T-4.6 [14]
5. Legal framework	Understand the obligations in relation to the international legal instruments that are part of the legal framework of the country	Handbook on Nuclear Law [15, 16]
	Understand the comprehensive nuclear law as well as the relevant legislation that has been amended accordingly	Handbook on Nuclear Law [15, 16]
6. Safeguards	Develop awareness of the requirements of nuclear material accounting and control in order to utilize effectively the resources necessary for this purpose, such as staffing, training and technical resources	Nuclear Material Accounting Handbook [17]
	Include in the BIS requirements on safeguards design features that would facilitate effective implementation of safeguards	NG-G-3.1 (Rev. 1) [1], section 3.6.2 NG-T-3.9 [12]
7. Regulatory framework	Develop with the regulatory body and, as needed, implement a protocol for communications about licensing and safety, security and safeguards issues	NG-G-3.1 (Rev. 1) [1], section 3.7.2 SSG-16 [10], Action 32 IAEA Nuclear Security Series No. 19 [18]
8. Radiation protection	Develop plans for monitoring and protecting workers and the public	NG-G-3.1 (Rev. 1) [1], section 3.8.2
	Reflect radiation protection plans in the plant's design requirements	NG-G-3.1 (Rev. 1) [1], section 3.8.2
	Develop plans for recruitment and training of radiation protection staff and the procurement of radiation protection equipment and services	NG-G-3.1 (Rev. 1) [1], section 3.8.2
9. Electrical grid	Implement detailed studies to determine any expansion, upgrade or improvement necessary to accommodate the size, technology and site for the new nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.9.2 NG-T-3.8 [19]
10. Human resource development	Identify competencies that will be needed in Phase 3 and beyond and establish plans for their development Plans should identify the future organizational structures as well as staff requirements and include recruitment and training plans based on gap analyses	NG-G-3.1 (Rev. 1) [1], section 3.10.2 NG-T-3.10 [20], sections 3 and 4
	Build upon the efforts initiated during Phase 1 to assess the domestic and foreign capacity for training the people who will be needed	NG-G-3.1 (Rev. 1) [1], section 3.10.1
	Build upon the efforts initiated during Phase 1 to assess the domestic research capabilities that may need to be developed	NG-G-3.1 (Rev. 1) [1], section 3.10.1

TABLE 1. MAIN ACTIVITIES OF THE OWNER/OPERATOR IN PHASE 2 (cont.)

Issue	Activity	Refs
	Determine the scope of the training system to be supplied by the vendor, ensuring that the scope corresponds to the established strategy and that those elements of the training system not included in that scope are understood and will be supplied through other mechanisms	NG-G-2.1 [21], appendix I
	Specify that training based on SAT will be required for both vendor provided and operating organization provided training for plant personnel	NG-G-2.1 [21], appendix I
	Plan for effective knowledge transfer and ensure that knowledge transfer provisions are incorporated into agreements and contracts associated with the nuclear power programme	SSG-16 [10], para. 3.12
11. Stakeholder involvement	Establish a stakeholder involvement programme	NG-G-3.1 (Rev. 1) [1], section 3.11.2 NG-T-1.4 [22]
	Explain the basic technology being employed, the construction plans, the safety responsibilities and the impact on, and benefits for, the local community	NG-G-3.1 (Rev. 1) [1], section 3.11.2 NG-T-1.4 [22]
	Establish public information centres, as appropriate	NG-G-3.1 (Rev. 1) [1], section 3.11.2 NG-T-1.4 [22]
12. Site and supporting facilities	Conduct a site assessment to justify the acceptability of the preferred sites based on detailed investigations and site characterizations (derivation of the site related design basis)	NG-G-3.1 (Rev. 1) [1], section 3.12.2 SSG-35 [23]
	Use site assessment results to derive the site related design basis, and reflect it in the BIS for the nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.12.2 NG-T-3.9 [12] NG-T-3.7 [24], sections 4 and 5
	Ensure the availability and integrity of the preferred site(s)	NG-G-3.1 (Rev. 1) [1], section 3.12.2
	Identify necessary improvements and develop implementation plans for local infrastructure at the preferred site or sites, such as access, services and facilities	NG-G-3.1 (Rev. 1) [1], section 3.12.2 NG-T-3.7 [24]
13. Environmental protection	Study the prospective impacts of nuclear power plant operation on people and the environment for its preferred candidate sites and to ensure that it can comply with the country's environmental laws and regulations For its preferred candidate site or sites, conduct environmental assessments according to the country's environmental laws and regulations	NG-G-3.1 (Rev. 1) [1], section 3.13.2 NG-T-3.11 [25]
	Include in the BIS a comprehensive specification of the environmental site conditions, factors, characteristics and data for the site(s)	NG-G-3.1 (Rev. 1) [1], section 3.13.2 NG-T-3.9 [12]

TABLE 1. MAIN ACTIVITIES OF THE OWNER/OPERATOR IN PHASE 2 (cont.)

Issue	Activity	Refs
14. Emergency planning	Work with the government, the regulatory body and the relevant national and local institutions to specify responsibilities of each organization for emergency preparedness and response relating to nuclear power plants	NG-G-3.1 (Rev. 1) [1], section 3.14.2 SSG-16 [10], Action 135 GSR Part 7 [26] GS-G-2.1 [27]
	Start implementing new arrangements as identified in Phase 1 for strengthening the infrastructure for emergency preparedness and response	SSG-16 [10], Actions 137–139 GSR Part 7 [26] GS-G-2.1 [27]
15. Nuclear security	Include in the BIS, specifications related to nuclear security and especially the design of the physical protection of the nuclear power plant	NG-T-3.9 [12]
	Plan programmes for the management of sensitive information, and for promotion of a nuclear security culture and trustworthiness of personnel	NG-G-3.1 (Rev. 1) [1], section 3.15.2 IAEA Nuclear Security Series Nos 7 [7] and 19 [18]
	Assign roles and responsibilities for detecting and responding to nuclear security events	NG-G-3.1 (Rev. 1) [1], section 3.15.2 IAEA Nuclear Security Series No. 19 [18]
16. Nuclear fuel cycle	Work with the government and the regulatory body to develop the national nuclear fuel cycle policy and strategy	NG-G-3.1 (Rev. 1) [1], section 3.16.2 NW-T-1.24 (Rev. 1) [28]
	Develop a BIS related to the nuclear fuel cycle	NG-G-3.1 (Rev. 1) [1], section 3.16.2 NG-T-3.9 [12]
17. Radioactive waste management	Develop for inclusion in the BIS provisions for radioactive waste management, including minimizing radioactive waste volumes and toxicity, requirements for associated facilities and requirements for a decommissioning plan	NG-G-3.1 (Rev. 1) [1], section 3.16.2 SSG-16 [10], Action 127 NG-T-3.9 [12] NW-T-1.24 (Rev. 1) [28]
18. Industrial involvement	Identify which national or local suppliers can reliably supply commodities, components or services to the nuclear related or non-nuclear portions of the nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.18.2 NG-T-3.4 [29]
	Identify what upgrades in skills and capabilities are realistic in the time frame that would be required to support nuclear construction	NG-G-3.1 (Rev. 1) [1], section 3.18.2
	Determine localization criteria to be included in the BIS	NG-G-3.1 (Rev. 1) [1], section 3.18.2 NG-T-3.9 [12]
	Encourage, with the support of the government, industrial organizations in the country to develop their capabilities with the objective of participating in the construction of nuclear power plant and supporting their safe long term operation	SSG-16 [10], Actions 63 and 64
19. Procurement	Establish a procurement capability for pre-project activities (e.g. environmental impact assessment, siting and consulting)	NG-G-3.1 (Rev. 1) [1], section 3.19.2

**Note:** BIS — bid invitation specification; SAT — systematic approach to training.

TABLE 2. MAIN RESPONSIBILITIES OF THE OWNER/OPERATOR IN PHASE 3

Issue	Activity	Refs
1. National position	Establish a mechanism to exchange information with operators in other countries through participation in the World Association of Nuclear Operators	NG-G-3.1 (Rev. 1) [1], section 3.3.3 SSG-16 [10], Action 17
2. Nuclear safety	Continue to implement the national policy and strategy for safety	SSG-16 [10], Action 9
	Implement a cooperation programme with the vendor and with other organizations operating nuclear power plants of the same type as that selected for the purposes of strengthening safety, reliability and sustainability	SSG-16 [10], Action 18
	Obtain support from external support organizations or individual experts in performing or reviewing safety assessments, as necessary	SSG-16 [10], Action 121
	Establish an internal entity, sometimes called the design authority, that will maintain the knowledge of the safety design and its configuration management over the lifetime of the plant	NG-G-3.1 (Rev. 1) [1], section 3.2.3
3. Management	Invite bids, evaluate the bids received and select the winning bid(s) in accordance with the bid evaluation criteria (if competitive bidding is used)	NG-G-3.1 (Rev. 1) [1], section 3.3.2
	Train staff and establish a project management organization that will emphasize quality management and be able to ensure that all contract requirements are fully met	NG-G-3.1 (Rev. 1) [1], section 3.3.2
	Prepare a licence application in compliance with the regulatory requirements	NG-G-3.1 (Rev. 1) [1], section 3.3.3
	Initiate and manage the contract, including appropriate auditing to verify compliance	NG-G-3.1 (Rev. 1) [1], section 3.3.3
	Complete construction and apply for a licence/ authorization to operate the plant	NG-G-3.1 (Rev. 1) [1], section 3.3.3
	Develop a contract for a continuing nuclear fuel supply	NG-G-3.1 (Rev. 1) [1], section 3.3.3
	Establish mechanisms for turnover responsibility from the main supplier to the owner/operator	NG-G-3.1 (Rev. 1) [1], section 3.3.3
	Clearly specify the roles and responsibilities of external support organizations	SSG-16 [10], Action 69
	Make appropriate arrangements to avoid conflicts of interest when obtaining external support	SSG-16 [10], Action 70
	Oversee the activities performed by external support organizations and contractors, and assess the quality of the services provided	SSG-16 [10], Action 71

TABLE 2. MAIN RESPONSIBILITIES OF THE OWNER/OPERATOR IN PHASE 3 (cont.)

Issue	Activity	Refs
	Ensure that senior management provides effective leadership and effective management for safety to ensure a sustainable high level of safety and a strong safety culture	SSG-16 [10], Action 78
	Establish appropriate arrangements for the management of safety related knowledge (including record and report management) and knowledge transfer	SSG-16 [10], Action 81
	Implement an integrated management system that promotes a strong safety culture.	SSG-16 [10], Actions 79 and 80
	Implement leadership and succession development programmes to develop future leaders with a strong emphasis on safety	SSG-16 [10], Action 82
4. Funding and financing	Continue to work on the financing plan for the nuclear power plant project, including a strategy for managing associated financial risks	NG-G-3.1 (Rev. 1) [1], section 3.4.2 NG-T-4.2 [13]
	Implement an agreement on the financing arrangements for the first nuclear power plant project based on the contract and financing negotiations (this stage is often called the final investment decision)	NG-G-3.1 (Rev. 1) [1], section 3.4.3
	Ensure that mechanisms are in place to meet the civil liability for nuclear damage in accordance with the nuclear legislation	NG-T-4.2 [13]
5. Legal framework	Ensure compliance with the international legal instruments that are part of the legal framework of the country	Handbook on Nuclear Law [15, 16]
	Ensure compliance with the comprehensive nuclear law as well as the relevant legislation that has been amended accordingly	Handbook on Nuclear Law [15, 16]
6. Safeguards	Submit design information to the state authority with responsibility for safeguards implementation	NG-G-3.1 (Rev. 1) [1], section 3.6.3
	Support installation of IAEA equipment for containment and surveillance	NG-G-3.1 (Rev. 1) [1], section 3.6.3
	Implement all elements of the safeguards infrastructure at the facility prior to fuel arriving at the first nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.6.3 IAEA Services Series Nos 15 [17] and 21 [8]
7. Regulatory framework	Maintain an effective working relationship and open communication with regulators	NG-G-3.1 (Rev. 1) [1], section 3.7.3
	Agree with regulators on the programme/schedule for licensing meetings, taking into account the important milestones of the first nuclear power plant construction schedule	NG-G-3.1 (Rev. 1) [1], section 3.7.3
	Submit the safety documentation required in the licensing process in a timely manner and be prepared to respond to enquiries from the regulatory body	

TABLE 2. MAIN RESPONSIBILITIES OF THE OWNER/OPERATOR IN PHASE 3 (cont.)

Issue	Activity	Refs
	Require organizations in the supply chain to comply with national safety requirements	
	Provide regulatory inspectors with unfettered access to the nuclear power plant and design information during inspections of construction and commissioning activities	
8. Radiation protection	Install radiation monitoring equipment at the nuclear power plant site prior to initial fuel being on-site	NG-G-3.1 (Rev. 1) [1], section 3.8.3
	Implement radiation dosimetry requirements for all workers prior to initial fuel being on-site	NG-G-3.1 (Rev. 1) [1], section 3.8.3
	Develop and implement programmes to minimize radiation exposure during plant operation and maintenance prior to initial fuel being on-site	NG-G-3.1 (Rev. 1) [1], section 3.8.3
9. Electrical grid	Implement the grid upgrade plans developed during Phase 2	NG-G-3.1 (Rev. 1) [1], section 3.9.3
	Develop arrangements to ensure coordination of grid operations with nuclear power plant operations	NG-G-3.1 (Rev. 1) [1], section 3.9.3 NG-T-3.8 [19]
	Verify the completion of all upgrades and enhancements to the grid and interconnections	NG-G-3.1 (Rev. 1) [1], section 3.9.3
	Install and test the redundant off-site power supplies to the nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.9.3
10. Human resource development	Recruit, hire and develop the project management organization needed early in Phase 3 to initiate efforts to acquire the first nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.10.3 NG-G-2.1 [21], appendix I
	Recruit, hire and develop the human resources necessary to commission and operate the first nuclear power plant based on needs as defined in workforce plans	NG-G-3.1 (Rev. 1) [1], section 3.10.3
	Arrange with the supplier or other owner/operators for training of the operations and maintenance team on existing similar plants	
	Specify that SAT based training will be required for both vendor provided and operating organization provided training for plant personnel	NG-G-2.1 [21], appendix I
	Implement plans for knowledge transfer Ensure that provisions for effective knowledge transfer are incorporated into the agreements and contracts associated with the nuclear power programme	SSG-16 [10], para. 3.12
	Develop and implement a SAT based training and a qualification programme for plant personnel	NG-G-2.1 [21], appendix I
	Qualify plant personnel for fuel loading and initial critical operation	NG-T-2.2 [30]

TABLE 2. MAIN RESPONSIBILITIES OF THE OWNER/OPERATOR IN PHASE 3 (cont.)

Issue	Activity	Refs
	Acquire or have access to a full scope plant specific simulator for training control room operators	NG-G-3.1 (Rev. 1) [1], section 3.10.3
	Develop and implement a systematic method of categorizing, disseminating and retaining knowledge, including training material, obtained through international cooperation and contracted commercial services	NG-G-3.1 (Rev. 1) [1], section 3.10.3 NG-G-2.1 [21], appendix I
	Build upon the efforts of Phase 2 to develop the full range of scientific, technical, managerial and administrative disciplines that will be needed and to assess their availability within the country	NG-G-3.1 (Rev. 1) [1], section 3.10.3
	Build upon the efforts during Phase 2 to develop and implement specialized recruiting and training that will be needed in nuclear safety, nuclear security, safeguards, radiation protection, management systems and emergency preparedness and response	NG-G-3.1 (Rev. 1) [1], section 3.10.3
	Develop domestic research and technical support capabilities over time, to support the work of the nuclear specialists	NG-G-3.1 (Rev. 1) [1], section 3.10.3
11. Stakeholder involvement	Continue to implement and assess the stakeholder involvement plan in conjunction with the government, the regulatory body and the relevant organizations in the programme, including: <ul style="list-style-type: none"> <li>— Communicating routinely about construction progress and preparations for operation</li> <li>— Communicating the operating organization’s plans for routine communication, once the nuclear power plant is operational, to all stakeholders including local communities</li> <li>— Communicating on the on-site and off-site emergency response plans</li> <li>— Continuing openly to discuss issues and how they are being addressed</li> </ul>	NG-G-3.1 (Rev. 1) [1], section 3.11.3 NG-T-1.4 [22]
12. Site and supporting facilities	Confirm the site’s suitability and the completion of all licensing and approval processes established by the nuclear regulatory body	NG-G-3.1 (Rev. 1) [1], section 3.12.3
13. Environmental protection	Complete all licensing and approval processes established by the nuclear regulatory body and the environmental regulatory body for the nuclear programme	NG-G-3.1 (Rev. 1) [1], section 3.13.3
	Implement an environmental monitoring programme, including the establishment of baseline data	NG-G-3.1 (Rev. 1) [1], section 3.13.3
14. Emergency planning	Develop and implement an emergency preparedness programme and emergency plans and procedures for nuclear power plant, and prepare the corresponding chapter of the safety analysis	SSG-16 [10], Action 141

TABLE 2. MAIN RESPONSIBILITIES OF THE OWNER/OPERATOR IN PHASE 3 (cont.)

Issue	Activity	Refs
	Demonstrate emergency response capabilities by conducting appropriate exercises that include local authorities and local communities	SSG-16 [10], Action 145
15. Nuclear security	Develop and receive approval of the security plan	NG-G-3.1 (Rev. 1) [1], section 3.15.3
	Construct, test and accept the physical protection system	NG-G-3.1 (Rev. 1) [1], section 3.15.3 IAEA Nuclear Security Series Nos 10 [31] and 13 [32]
	Demonstrate the effectiveness of the system for protecting nuclear material and facilities, through inspections, verification and on-site exercises	NG-G-3.1 (Rev. 1) [1], section 3.15.3
	Implement the national response plan, including arrangements with outside response forces, to supplement on-site response, as well as training and exercises	NG-G-3.1 (Rev. 1) [1], section 3.15.3 IAEA Nuclear Security Series No. 13 [32]
16. Nuclear fuel cycle	Develop plans to implement the interim storage strategy, including identifying a suitable location, transport capabilities and funding arrangements	NG-G-3.1 (Rev. 1) [1], section 3.16.3 NW-T-1.24 (Rev. 1) [28]
17. Radioactive waste management	Put in operation enhanced or new facilities for the storage or disposal of low and intermediate level waste to be prepared to receive radioactive waste from the nuclear power plant	NG-G-3.1 (Rev. 1) [1], section 3.17.3 SSG-16, Action 130 [10] NW-T-1.24 (Rev. 1) [28]
	Develop an initial decommissioning plan as part of the licensing of the first nuclear power plant units	NG-G-3.1 (Rev. 1) [1], section 3.17.3 GSR Part 6 [33]
	Monitor international efforts and progress with regard to the disposal of radioactive waste	SSG-16 [10], Action 132
18. Industrial involvement	Promote educational and industrial development for national participation in the nuclear programme	NG-G-3.1 (Rev. 1) [1], section 3.18.3 NG-T-3.4 [29]
	Implement decisions made in the BIS about using national or foreign sources for commodities, components and services	NG-G-3.1 (Rev. 1) [1], section 3.18.2
	As the construction phase of the first nuclear power plant project nears completion, reassess the capability of national/local supply sources to support operation	NG-G-3.1 (Rev. 1) [1], section 3.18.3
19. Procurement	Establish a procurement organization with the programmes and skills necessary to conduct ongoing purchasing of equipment and services during Phase 3	NG-G-3.1 (Rev. 1) [1], section 3.19.3 NP-T-3.21 [34]

**Note:** BIS — bid invitation specification; SAT — systematic approach to training.

## 5. MANAGING GROWTH AND CHANGE

### 5.1. ESTABLISHING THE OWNER/OPERATOR ORGANIZATION

The first step in establishing an owner/operator is the appointment of a core group of competent managers and key specialists from which the organization can be built and at least some of whom should have participated in the Phase 1 work of the NEPIO. The organization can be newly established or developed as part of an existing power utility.

Some embarking countries have chosen the latter option, which has the advantage of benefiting from the existing physical, institutional and human infrastructure available in the power utility. Examples of such infrastructure include quality assurance programmes, document management systems, procurement processes and IT support. In addition, several competencies available in the areas of finance, legal, project management, operations and maintenance can be useful for the future nuclear power plant project. This approach, however, may also lead to conflicts of priority between conventional projects and the nuclear power project and will require an understanding of the unique needs of a nuclear project by the senior management of the utility.

Other embarking countries have established a new owner/operator organization with staff from nuclear research organizations or atomic energy commissions, if they exist. In such cases, the structure and management systems of the owner/operator organization need to be built from scratch. The staff might also not have the project management skills necessary for the development and implementation of a large scale commercial project.

In both cases, a key task for the core group of managers and specialists appointed to lead the project is the establishment of a programme to foster an organizational culture that recognizes the importance of safety, security and safeguards. This core group should instil this culture through its leadership in the organization as well as in its contractors.

### 5.2. EVOLUTION OF THE ORGANIZATION

It is important to recognize that the structure and staffing of the owner/operator is not static but evolves in response to the needs in different phases (see Fig. 5). In Phase 1, an owner/operator is normally not identified. The NEPIO will prepare the pre-feasibility studies, including drafting policies and strategies that will influence the activities of the owner/operator in Phase 2.

In Phase 2, the owner/operator functions as a project development organization. The structure of this organization will evolve rapidly as the number of staff increases. During this phase, the organization will develop

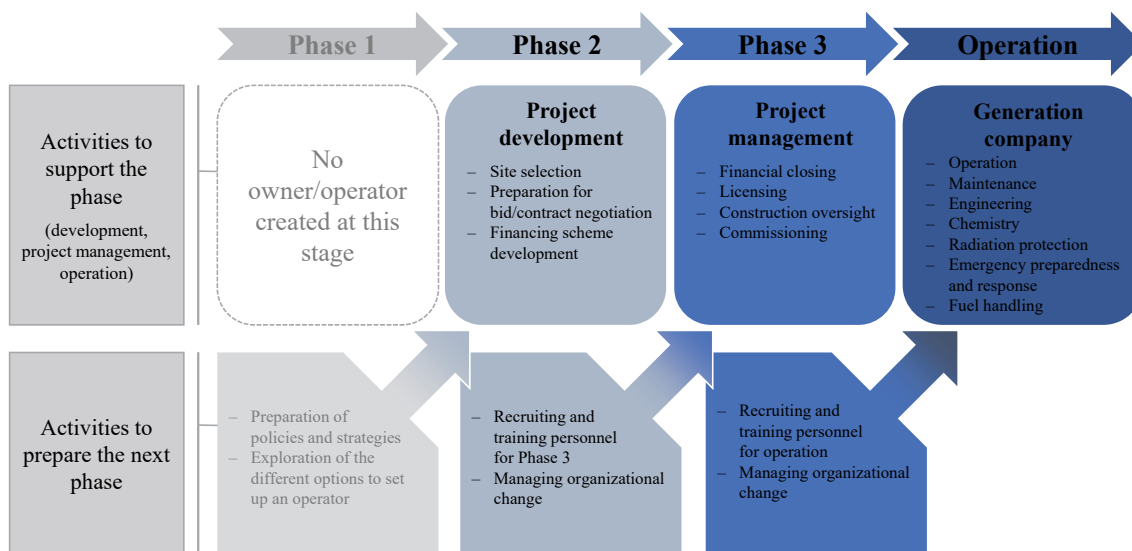

FIG. 5. The changing nature of activities of the owner/operator.

the capability to specify technical requirements and negotiate with potential vendors and partners. At the same time, it needs to recruit and train the staff required for Phase 3. As the project moves into Phase 3, the owner/operator becomes a project management organization and addresses three significantly different issues, namely financing and contracting, managing construction oversight and preparing the licence applications. At the same time, it needs to recruit and train the staff needed for commissioning and future operation. Typical organizational charts for Phases 2 and 3 are presented in Figs 6 and 7.

Table 3 details the number of staff necessary for a two unit project through an EPC contract. Once the reactor technology is known, the owner/operator should prepare a detailed human resource development plan, in consultation with the vendor, to support Phase 3. While the number of personnel required for commissioning and operation is well known, fewer data are available for the early phases of the project, and the figures may vary greatly depending on the use of external support and the pace of the nuclear power plant project.

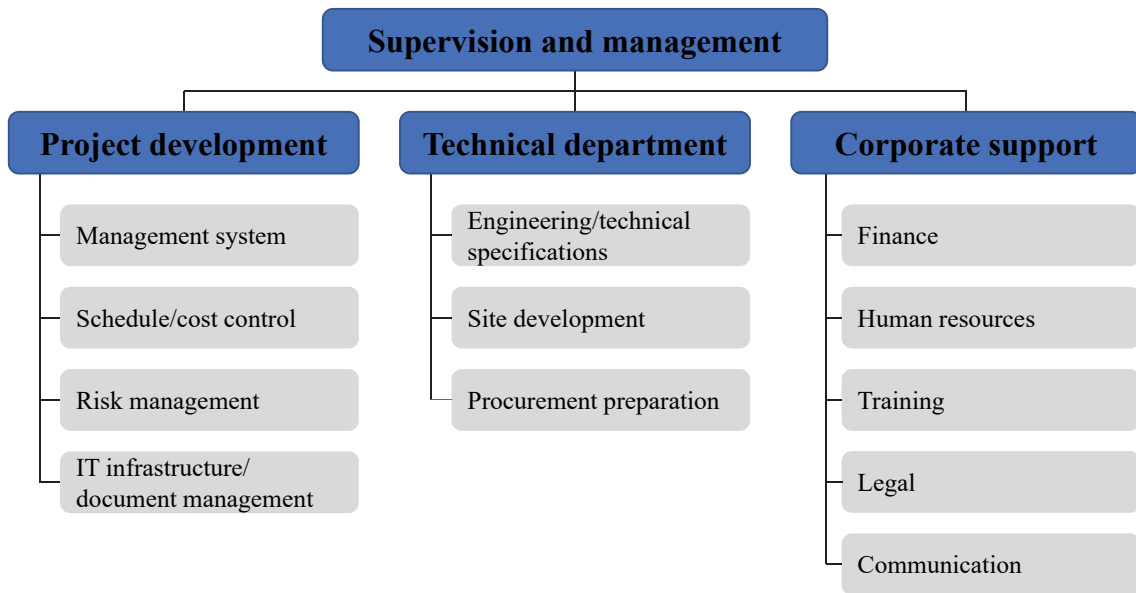

FIG. 6. Organizational chart for Phase 2.

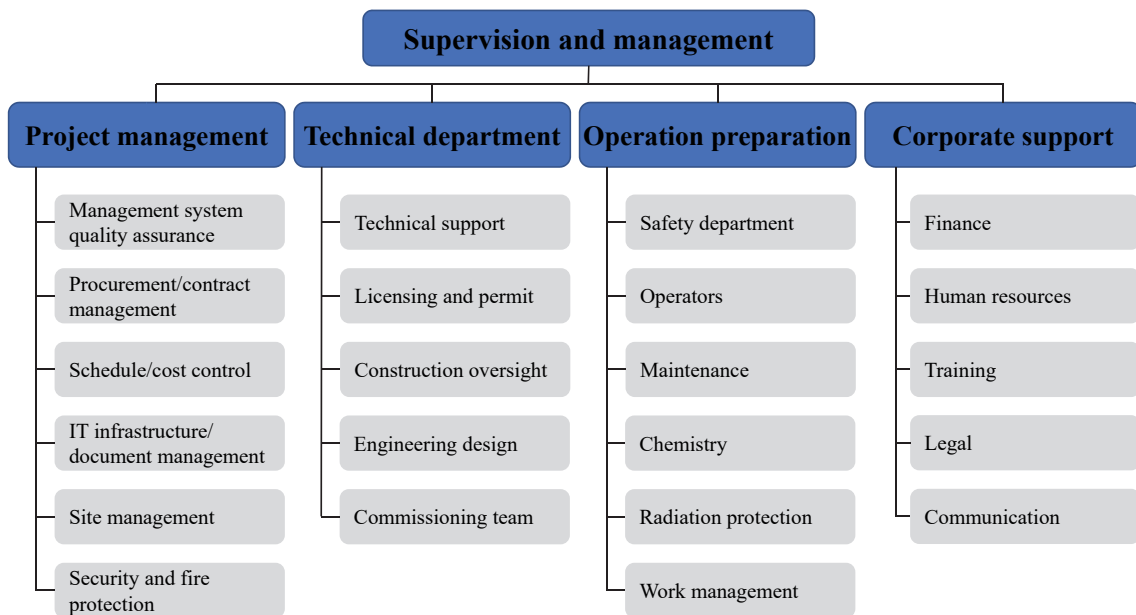

FIG. 7. Organizational chart for Phase 3.

TABLE 3. AVERAGE NUMBER OF TECHNICAL STAFF IN THE OWNER/OPERATOR ORGANIZATION AT DIFFERENT STAGES OF AN EPC CONTRACT: TWO 1000 MW UNITS

Division	During project development (Phase 2)	During construction (Phase 3)	During commissioning (at Milestone 3)	At operation	Comments
Engineering	20	80	80	70	Engineers during operation will not have the same profile as during construction (material and system engineers)
Planning and project control	20	20	50	50	Numbers assume operating staff will be responsible for outage management
Material control and management	10	40	20	0	
Construction control	10	30	20	0	
Commissioning	0	50	170	0	Some staff (but not all) may join the maintenance team at operation
Maintenance	0	0	100	230	Includes instrument and control, mechanical, electrical and logistics
Technical support	5	15	100	100	Includes industrial safety, radiological protection, chemical, fire prevention
Management, human resources, training and procurement	15	125	60	100	Includes finance and contract control
Nuclear safety and quality management	20	20	30	30	
Security and physical protection	5	30	60	60	
Operators for both units	0	60	180	180	
<b>Total</b>	<b>105</b>	<b>470</b>	<b>870</b>	<b>820</b>	

**Note:** The table focuses on the staff in the owner/operator organization. The number of employees from the vendor or subcontractors who were involved in construction and commissioning is not included.

### 5.3. ACQUIRING AND DEVELOPING THE REQUIRED COMPETENCIES

One of the first activities to be performed by the owner/operator is an analysis of the competencies required to support the activities to be conducted in Phases 2 and 3. While many of the owner/operator's activities require in-house competencies, it may be more appropriate for others to be outsourced. The determination of which activities will be performed in-house and those that will be outsourced will have an impact on the organization's recruitment plan and its training programme. Figure 8 shows the typical decision making process and a number of factors to be considered.

To make effective use of outsourcing, the owner/operator still needs the competency to specify the work to be performed and to supervise its implementation. This capacity is known as being a knowledgeable customer. Several

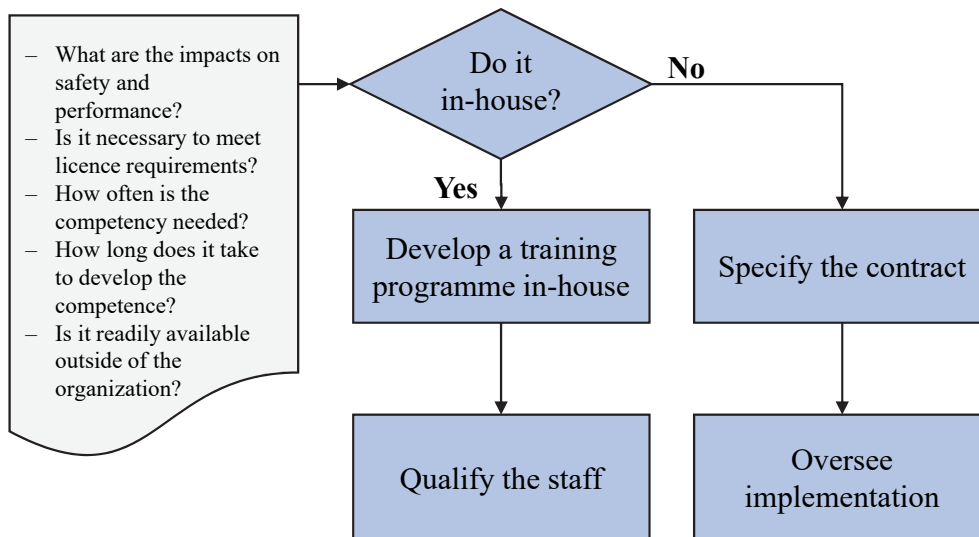

FIG. 8. Process to identify the competencies needed depending on whether or not an activity is outsourced.

embarking countries that have outsourced activities also used this opportunity to develop their own competencies by including in the contract an element of training (e.g. shadowing, mentoring and on the job training). If the decision is made to perform a given activity in-house, the development of the required competencies often necessitates early considerations related to recruitment and training, especially for those positions with long lead times. Typically, the approach to recruitment and training will follow a phased approach once the organization is formed.

### 5.3.1. Recruitment

Recruiting appropriate staff is central to the development of a successful organization. For activities that will be done in-house, the staff overseeing the recruitment process, together with the management of the organization, should develop job profiles. The organization should consider existing human resource pipelines in the country to support the initial recruitment, as well as the continuous and dynamic cycle that will impact the overall recruitment process (see Fig. 9).

In addition to reviewing the existing educational and vocational pipelines, the owner/operator should also consider other relevant industries, such as electrical utilities, as well as nuclear research organizations as potential recruitment options. All the individuals recruited, including experienced staff recruited externally, will require training, development and qualification before setting to work. Given that workforce planning is a dynamic process,

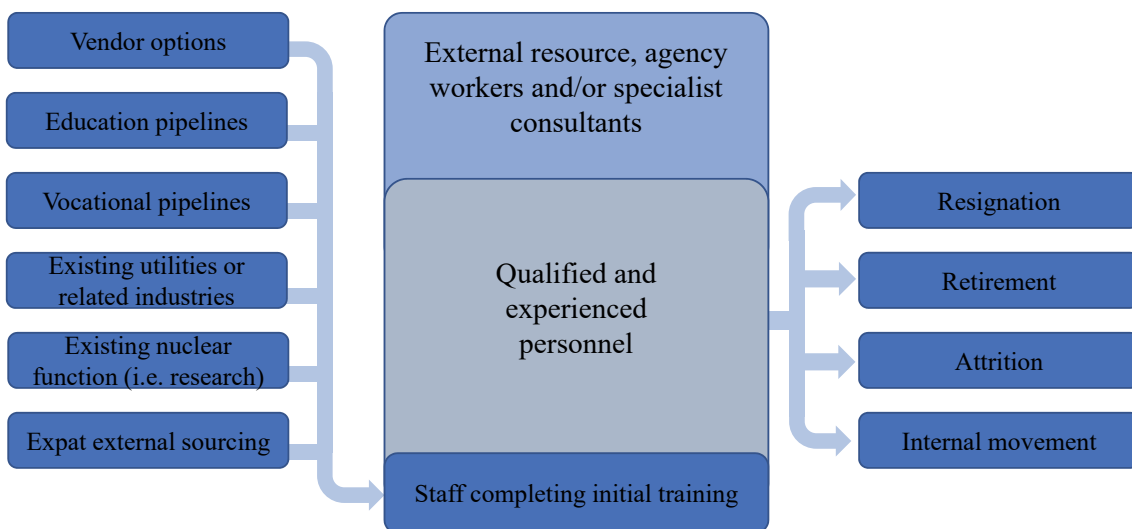

FIG. 9. Recruitment life cycle activities.

the owner/operator's recruitment plan should also consider the potential loss of qualified staff through resignations, retirement, attrition and internal movement. The owner/operator will supplement its staff with an external resource, such as a TSO or consultants, for specific tasks. The recruitment plan will evolve as the organization moves from Phase 2 to Phase 3, and as new competencies are required.

The number of personnel recruited from the various sources will depend on the programme specifics, such as the number of units to be constructed and the contractual arrangements with the vendor. In some cases, it may be necessary to conduct surveys of existing national education programmes and vocational training organizations to determine the national capability to meet the programme demands. Where a shortfall of capacity is identified, it will be necessary for the owner/operator to put in place arrangements with the government to ensure sustainable educational and vocational pipelines are in place to support the long term demands of the nuclear power programme. Options for recruitment and workforce planning are discussed in Refs [20, 21].

### **5.3.2. Training**

As with the recruitment process, the owner/operator needs to develop a training programme aligned with the overall objectives of the nuclear power programme. This programme will provide initial training to new staff as they are recruited and continuing training for existing staff. Therefore, the owner/operator needs to establish a training department in Phase 2 to conduct these activities as well as to support the development of future instructors.

In Phase 3, the majority of the plant specific training will be provided by the vendor through the EPC contract. However, this training is usually limited to maintenance and operation, and areas such as engineering, management and security may require separate training programmes. It is expected that a training centre at the site will be operational in Phase 3, which will play a role in training staff during construction. The development of the training programme needs to take into account that some job positions require long lead times and, possibly, language training. It is important to recognize that for many job positions, actual experience at an operating nuclear power plant is required in addition to classroom training. This applies not only to control room operators but also to several specialist and managerial positions. Therefore, training plans should be developed for each job position in a systematic way. The training model used throughout the nuclear industry is the systematic approach to training (SAT), which includes the following steps:

- Analysis of the competencies needed for the job;
- Design of the training to convert the competencies into learning objectives;
- Development of the training material to achieve the learning objectives;
- Implementation of the training using the material developed;
- Evaluation of the training, with feedback for continual improvement.

This approach has become an industry standard and is even a regulatory requirement in some countries. Therefore, the owner/operator needs to ensure that all staff involved in the development of the organization's training programme, including the vendor's training personnel, are competent in the use of SAT based training programmes.

## **6. INTERFACE WITH STAKEHOLDERS**

All the organizations involved in the nuclear power programme will have stakeholders that need to be engaged throughout the different phases. The owner/operator in particular has to engage with a large number of stakeholders, including the public. Figure 10 shows typical stakeholders and their interface with the owner/operator.

Stakeholders for the owner/operator typically include national, regional and local authorities, regulatory bodies, the vendor, emergency response organizations, TSOs, the grid operator and the police, among others. One of the most important stakeholders is the public, especially the community living or working near the nuclear power plant site. Other stakeholders of interest include the media, non-governmental organizations, educational institutions, other nuclear power operators, international organizations and owners' groups.

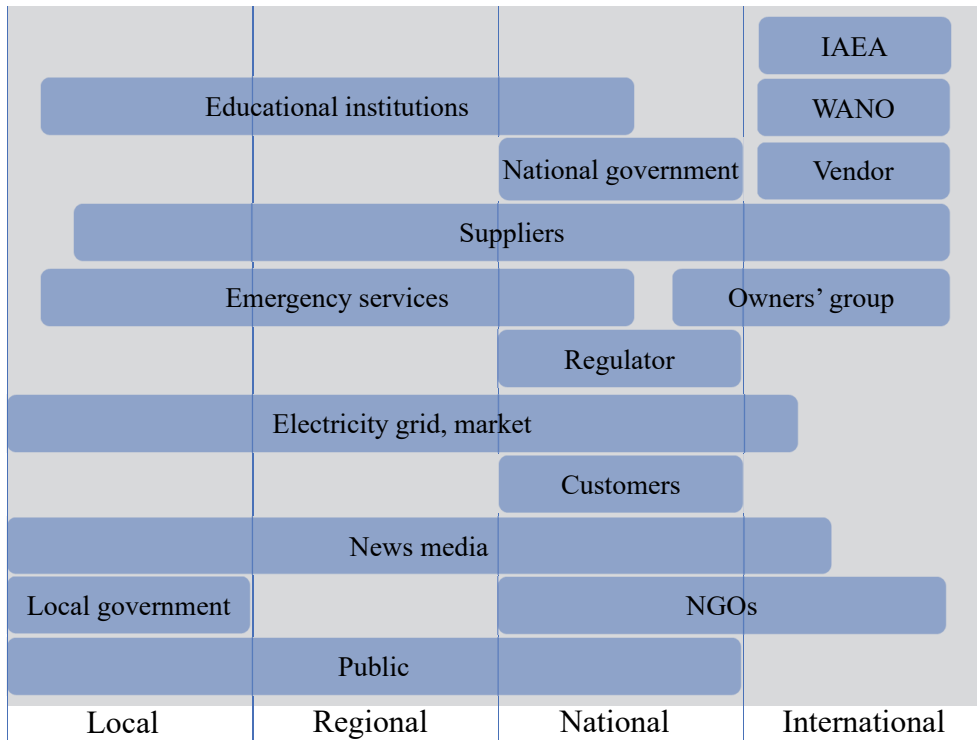

FIG. 10. Typical interface of stakeholders with the owner/operator.

In Phase 2, the owner/operator should establish a stakeholder involvement strategy and plan and initiate engagement with identified stakeholders. This strategy and plan may benefit from previous work performed at the national level in Phase 1 and should be coordinated through the NEPIO with the plans of the other key organizations (see Ref. [22] on the development of a stakeholder strategy and plan).

### 6.1. INTERFACE WITH THE GOVERNMENT AND THE NEPIO

The NEPIO, which has the role of national coordination, is a key stakeholder in Phases 2 and 3, as the owner/operator is responsible for the implementation of the relevant policies developed by the NEPIO. The owner/operator has to identify the activities for which it will need support from the government. In Phase 2, the owner/operator needs support from the government and the relevant ministries to establish the investment framework and the definition of the contracting strategy. The owner/operator also needs to work with the NEPIO to determine which enhancements are necessary in the educational system to ensure the availability of individuals with appropriate backgrounds. Industrial involvement policy, prepared by the NEPIO in Phase 1, also needs to be considered as the owner/operator is preparing for contract negotiation. Finally, international cooperation will also contribute to the development of the owner/operator, and this will require intergovernmental coordination led by the NEPIO.

### 6.2. INTERFACE WITH THE REGULATORY BODY

At every stage of the project, the owner/operator needs to interact with the regulatory bodies (for safety, security, safeguards and environmental protection) to ensure compliance with the legal and regulatory frameworks. Mechanisms should be established to support communication and information exchange between the organizations for this purpose. The owner/operator needs to provide the regulatory inspectors with unfettered access to the nuclear power plant, including design and operational information, to assess compliance with regulatory and licensing requirements.

Typical interactions include regular meetings, presentation of plans and progress reports, applications for licences and permits, and submission of safety documentation for obtaining approvals. The owner/operator may also receive formal letters requesting information or specific actions, or formal instructions from the regulator(s), and it may consider establishing a process to manage and respond to these requests in a timely manner.

### 6.3. INTERFACE WITH THE GRID OPERATOR

The owner/operator should also establish communication protocols with the grid operator in Phase 2, as it will need to provide information concerning the location, size and typical technical requirements of the nuclear power plant. The grid operator will first use this information to estimate the necessary upgrades to the grid that are required to provide electricity to the nuclear power plant construction site. Once the technology is chosen, there will be additional enhancements to ensure that the grid connections to the nuclear power plant are sufficient, and can also provide the plant with a reliable external electrical supply that is independent of plant output.

In addition, the grid operator may require the nuclear power plant to have certain performance characteristics to ensure the proper operation and security of the electrical grid. The owner/operator will need to agree on such requirements and include them in the contract specifications for the nuclear power plant. The owner/operator and the grid operator will also need to agree on the schedule for grid enhancements in order to complete them prior to commissioning the nuclear power plant. By the end of Phase 3, the owner/operator will need to have arrangements in place for routine communication between the nuclear power plant and the grid operator, including for maintenance of the grid and planned outages of the plant.

### 6.4. INTERFACE WITH THE VENDOR, MAIN CONTRACTOR AND SUBCONTRACTORS

The responsibilities of the organizations participating in the construction of the nuclear power plant will depend on the nature of the contracts used for procurement. In all contract arrangements, including turnkey contracts, the owner/operator retains the ultimate responsibility for the safety aspects of the project and for ensuring that the construction of the plant meets the necessary quality and safety standards. The owner/operator will need to ensure that the national safety requirements are understood and applied throughout the supply chain by the EPC contractor.

During the licensing process, the owner/operator will need technical support from the vendor. This support will continue after commissioning, as long term support is expected at the operational phase of the plant.

### 6.5. INTERFACE WITH THE WASTE MANAGEMENT ORGANIZATION

When in operation, the nuclear power plant will generate waste and spent fuel, for which the owner/operator is responsible. It will need to liaise with a waste management organization as defined by national laws and regulations. While this organization might not exist at the time of construction, the owner/operator should analyse the nature and volume of waste and spent fuel that will be generated.

The owner/operator and the waste management organization will have to implement the national waste policy decided in Phase 2. Regular exchanges and communication will take place between the two organizations for this purpose.

### 6.6. INTERFACE WITH THE EMERGENCY PLANNING AND RESPONSE ORGANIZATIONS

The owner/operator is responsible for implementing on-site emergency plans and procedures. It will also need to establish interfaces with local and national emergency planning and response organizations (central government agencies, local government agencies, fire brigade, police, ambulance, hospital services) to ensure effective coordination. These interfaces should be formalized through emergency planning arrangements and routinely tested through local and national drills.

## 6.7. INTERFACE WITH THE PUBLIC AND NEIGHBOURING COUNTRIES

Maintaining public support for the nuclear power plant project requires joint efforts from the NEPIO and the owner/operator. The government role lies more at the national level to provide the justification for the nuclear power programme with support from the owner/operator, while the owner/operator has a major role in informing the public at a local level, in line with the national policy. The government and the regulatory body need to promote the roles and responsibilities of an independent regulator in the oversight of the nuclear power plant. The support of individuals living close to the proposed site of the nuclear power plant will be particularly important and should be consulted by the owner/operator in Phase 2.

The owner/operator may include the establishment of public information centres as part of its overall communication strategy. These centres can be located at the site as well as in larger metropolitan areas. Neighbouring countries also have an interest in the new nuclear power programme; however, their involvement will be facilitated by the government.

## 6.8. INTERFACE WITH INTERNATIONAL ORGANIZATIONS

The owner/operator is expected to participate in activities organized by international organizations and the relevant owners' group. This will provide the new owner/operator with a way of obtaining valuable information on the practical experience of other organizations in the construction and operation of nuclear power plants and the lessons learned.
