## **FOREWORD**

This report is the fortieth in the Agency's series of annual reports on operating experience with nuclear power stations in Member States.

As in previous years, in addition to annual performance data and outage information, the report contains a historical summary of performance and outages during the lifetime of individual plants and six figures illustrating worldwide performance and statistical data. Since 2006 the report is in an electronic version on CD-ROM which provides enhanced features for data searching and analysing.

It is hoped that this report and related Agency publications will be useful to everyone concerned with nuclear power reactors. Suggestions and corrections from readers would be most welcome.

## 1. INTRODUCTION

This report is the fortieth in the Agency's series of annual reports on operating experience with nuclear power stations in Member States. For the fourth time it is issued purely in an electronic version.

The report is a direct output from the Agency's Power Reactor Information System (PRIS), whose databank contains all operating experience data published in the Agency's operating experience annual reports since 1970 and basic information on power reactors, including design data. It presents operating experience data for all worldwide nuclear power plants after starting commercial operation. The PRIS databank is available free of charge to IAEA Member States through its three services: PRIS-Statistics, PRIS-PC, and PRIS CD-ROM. The PRIS-Statistics and PRIS-PC allow direct access to the database through the Internet. Those front-end-tool interfaces allow searching and querying through pre-designed statistics. PRIS outputs are also available on the PRIS web-site: [www.iaea.org/pris](http://www.iaea.org/pris). It contains publicly available information about reactor units and nuclear industry results.

Load, operation and availability factors are used as the basic performance indicators. Energy unavailability factors, separately for planned and unplanned unavailability (due either to causes under plant management control or external causes out of plant management control), are used as a measure of energy lost through a unit not being available. However, some ambiguity remains in the operators' reports of the unavailability data, resulting in inconsistencies in these factors. It is recognized that there is an inherent difficulty in reporting unavailability in energy due to external causes with relation to energy losses due to load following operation and grid limitation. It should be noted that, for load, operation and unavailability factors, there might be differences between the data of this report and those published elsewhere. To avoid confusion, reference should be made to the definitions given in Section 2. In Section 3 this report presents figures illustrating worldwide performance indicators up to 2008.

According to the information available to the Agency at the end of 2008, there were 438 nuclear power reactors operating in the world, with a total net capacity of 371.6 GW<sub>(e)</sub>.

In 2008 no new reactors were connected to the grid. It was the first year since 1955 without at least one new reactor coming on line. One reactor was permanently shut down : Bohunice 2 (408 MW<sub>(e)</sub>) in Slovakia.

At the end of 2008 there were 44 nuclear power plants under construction in the world with a total net capacity 40 GW<sub>(e)</sub>. In 2008 there were ten construction starts: Ningde 1 and 2, Hongyanhe 2, Fuqing 1, Yangjiang 1 and Fangjiashan 1, in China, Novovoronezh 2-1 and Leningrad 2-1 in Russia, Shin Kori 3 and Shin-Wolsong 2 in the Republic of Korea.

The scope of publication has been enhanced by information related to non-electrical application of nuclear power reactors. Section 6 consists of production data related to district heating, industrial process heat delivery and to water desalination. In 2008 the nuclear energy was utilized for non-electrical application in 11 Member States involving energy from 74 nuclear reactors.

The 2009 edition has been extended by detail design characteristics of reactor units and by dashboards providing a general overview of each individual operating nuclear power plant.

This publication includes information received by the Agency up to 1 June 2009. Up to this date data from all operating units had been reported. Any data modification received after that date, although not included in this publication, is available in the PRIS database.

The information contained in the report was made available to the Agency through designated national correspondents. The Agency appreciates the valuable assistance of the national authorities, official correspondents and various electrical utilities in gathering the information for this report.

The report was compiled by staff of the Agency's Division of Nuclear Power. It is hoped that it will be useful to nuclear power plant operators, nuclear system designers, nuclear power planners, interested professional engineers and scientists and others concerned with the operating experience of nuclear power reactors. Suggestions and corrections from readers would be most welcome.

## 2. DEFINITIONS

### 1. Reference Unit Power, RUP [ $\text{MW}_{(e)}$ ]

The reference unit power is the maximum (electrical) power that could be maintained continuously throughout a prolonged period of operation under reference ambient conditions.

It is specified that this value must remain constant for a given unit unless, following permanent modification, or a new permanent authorization, the management decides to amend the original value.

The reference unit power may be gross or net:

- The gross RUP ( $P_g$ ,  $\text{MW}_{(e)}$ ) is deemed to be measured at the output terminals of all generator sets in the station; it includes therefore the power taken by the station auxiliaries and losses in transformers that are considered integral parts of the station.

- The net RUP ( $P_n$ ,  $\text{MW}_{(e)}$ ), indicating the maximum power that can be supplied, is measured at the station outlet terminals, i.e. after deducting the power taken by station auxiliaries and the losses in the transformers that are considered integral parts of the station.

### 2. Design net capacity [ $\text{MW}_{(e)}$ ]

The net reference unit power as specified in an original unit design.

### 3. Reference period, T [hours]

For units in power ascension at the end of the period, the clock hours from the beginning of the period or the first electrical production, whichever comes last, to the end of the period.

For units in commercial operation at the end of the period, the clock hours from the beginning of the period or of commercial operation, whichever comes last, to the end of the period or permanent shutdown, whichever comes first.

### 4. On-line hours, t [hours]

The total clock hours in the reference period during which the unit operated with breakers closed to the station bus.

### 5. Reference Energy Generation, REG [ $\text{MW}_{(e)}\text{h}$ ]

Net electrical energy which would have been supplied to the grid if the unit were operated continuously at the reference unit power during the whole reference period.

### 6. Energy Generated (net), EG [ $\text{GW}_{(e)}\text{h}$ ]

Net electrical energy produced during the reference period as measured at the unit outlet terminals, i.e. after deducting the electrical energy taken by unit auxiliaries and the losses in transformers that are considered integral parts of the unit. If this quantity is less than zero, zero is reported.

## 7. Load Factor, LF [%]

$$LF = \frac{EG}{REG} \times 100$$

EG = energy generated (net), [MW<sub>(e)</sub>h]  
REG = reference energy generation [MW<sub>(e)</sub>h]

Load factor, for a given period, is the ratio of the energy, which the power unit has produced over that period, to the energy it would have produced at its reference power capacity over that period.

## 8. Operation factor, OF [%]

$$OF = \frac{t}{T} \times 100$$

t = number of hours on-line [h]  
T = number of hours in the reference period [h]

Operation factor is the ratio of the number of hours the unit was on-line, to the total number of hours in the reference period, expressed as a percentage. It is a measure of the unit time availability on the grid and does not depend on the operating power level.

## 9. Available capacity, P [MW<sub>(e)</sub>]

The available capacity at a given moment is the maximum net capacity at which the unit or station is able or is authorized to be operated at a continuous rating under the prevailing conditions assuming unlimited transmission facilities.

## 10. Energy loss, EL [MW<sub>(e)</sub>h]

Energy loss is the energy which could have been produced during the reference period by the unavailable capacity; it is categorized into three types:

- PEL - planned energy loss
- UEL - unplanned energy loss
- XEL - energy loss due to causes external to the plant

UEL comprise shutdowns, unplanned load reductions or outage extensions.

## 11. Unavailability

The unit unavailability is defined as a status when the plant is not able to operate at its maximum capacity (reference power). This condition, which may be under or beyond plant management control, should only reflect lack of availability of the plant itself, regardless of energy demand, transmission grid condition or political situation in the country.

Unavailability is classified as planned if it is foreseen at least 4 weeks in advance, generally at the time when the annual overhaul programme is established, and if the beginning of the unavailability period can be largely controlled and deferred by management. Unavailability is classified as unplanned if not scheduled at least four weeks in advance. Power plant operation at lower than maximum capacity because of lower demand from the grid but available to operate at the maximum capacity, does not constitute unavailability, either planned or unplanned.

## 12. Energy Availability Factor, EAF [%]

$$EAF = \frac{REG - PEL - UEL - XEL}{REG} \times 100$$

The energy availability factor over a specified period, is the ratio of the energy that the available capacity could have produced during this period, to the energy that the reference unit power could have produced during the same period.

### 13. Energy Unavailability Factor, EUF [%]

$$EUF = \frac{EL}{REG} \times 100$$

The unavailability factor over a specified period is the ratio of the energy losses EL that have not been produced during this period due to the unavailable capacity, to the energy that the reference unit power could have produced during the same period.

The energy unavailability factor EUF over a specified period can be divided into:

PUF = planned unavailability factor

UUF = unplanned unavailability factor due to causes in the plant

XUF = unplanned unavailability factor due to causes external to the plant.

The unavailability factor can be expressed as:  $EUF = 100 - EAF$

### 14. Unit capability factor, UCF [%]

$$UCF = \frac{REG - PEL - UEL}{REG} \times 100$$

Unit capability factor is defined as the ratio of the energy that the unit was capable to generate over a given time period considering only limitation under the plant management control, to the reference energy generation over the same time period, expressed as a percentage. Both of these energy generation terms are determined relative to reference ambient conditions.

### 15. Construction start

Date when first major placing of concrete, usually for the base mat of the reactor building, is done.

### 16. First criticality

Date when the reactor is made critical for the first time.

### 17. Grid connection

Date when the plant is first connected to the electrical grid for supply of power.

### 18. Commercial operation

Date when the plant is handed over by the contractors to the owner and declared officially to be in commercial operation.

### 19. Permanent Shutdown

Date when the plant is officially declared shut down by the owner and taken out of operation permanently.

### 20. Long-term Shutdown

A unit is considered in the long-term shutdown status, if it has been shut down for an extended period (usually several years) without any firm recovery schedule at the beginning but there is the intention to re-start the unit eventually.

### 21. Outages

For the purpose of PRIS coding, the outage is defined as any status of a reactor unit, when its actual output power is lower than the reference unit power for a period of time. By this definition, the outage includes both power reduction and unit shutdown. The outage is considered significant, if the loss in the energy production corresponds to

at least ten hours of continuous operation at the reference unit power or if it has been caused by an unplanned reactor scram (even if the unit had been shut down for less than 10 hours).

## **22. Outage duration [h]**

The total clock hours of the outage measured from the beginning of the reference period or the outage, whichever comes last, to the end of the reference period or the outage, whichever comes first.

**23. Factors** refer to the plants which were in commercial operation during the whole of the reference period.

**24. Cumulative factors** are given for the plants which were in commercial operation during full calendar years.

**25.** A blank and three periods (...), if used in tables, denote information that is not applicable or not available, respectively.

## **26. Types of outages**

The outage type is a three-character code. The third character is for unplanned outages only:

Code\_1 description:

- (P) Planned outage due to causes under the plant management control
- (U) Unplanned outage due to causes under the plant management control
- (X) Outage due to causes beyond the plant management control ("external")

- (2) Controlled shutdown or load reduction that had to be performed in the next 24 hours after the cause occurred
- (3) Extension of planned outage

### 4. 2008 Summary of Operation

REFLECTING SG DEGRADATION THE RUP WAS CHANGED TO 491 MWE (520 MWE IS THE GROSS CAPACITY) FOR 80% POWER. THIS IS A TEMPORARY MODIFICATION AND THE UNIT WILL RETURN TO 657MWE (GROSS) AND 626MWE (NET) AS SOON AS THE STEAM GENERATORS WILL BE REPLACED (IN 2009). IN 2008, ANGRA 1 REMAINED SYNCHRONIZED TO THE SYSTEM PER 294 DAYS. IN 2008, ANGRA 1 COMPLETED 27 YEARS OF ITS FIRST CRITICALIDADE AND ITS FIRST SYNCHRONISM TO THE NATIONAL GRID, AND SURPASSED THE PRODUCTION OF LAST THE 2 YEARS, WITH 3.515.485, 9 MWH OF GROSS GENERATION, EVEN OPERATING DURING ALL THE YEAR WITH THE LIMITATION OF 80% OF ITS MAXIMUM POWER AND THE EXTENSIVE PROGRAM OF MAINTENANCE FOR OCCASION OF THE SCHEDULED OUTAGE, NECESSARY FOR THE PRESERVATION OF THE STEAM GENERATORS. THE OUTAGE 1P15A WAS PLANNED AND CARRIED THROUGH IN 60 DAYS, INITIATING AT 00H00MIN OF DAY 16/02/2008 AND FINISHED AT 00H40MIN OF DAY 16/04/2008. THE PREPARATORY ACTIVITIES FOR THE STEAM GENERATORS REPLACEMENT INCLUDED TESTS, INSPECTIONS AND REPAIRS IN THE PIPES OF THE STEAM GENERATORS.

### 4. 2008 Summary of Operation

PLANNED OUTAGE IN FALL OF 2008 INCLUDED A VERY SUCCESSFUL WESTSHIFT PROGRAM. THE PREVIOUS REFERENCE UNIT POWER OF 750 MW HAD BEEN ESTABLISHED PRIOR TO THE UNIT 3 RESTART AND NEEDED SUFFICIENT ACTUAL OUTPUT RESULTS BEFORE THIS COULD BE UPDATED. ENGINEERING ANALYSIS AND MANAGEMENT HAS ACCEPTED THAT UNIT OUTPUT WILL BE LOWER.

### 4. 2008 Summary of Operation

PLANNED OUTAGE IN SPRING OF 2008 INCLUDED BOILER INSPECTIONS WHICH DEMONSTRATE BETTER EQUIPMENT CONDITION THAN EXPECTED. THE PREVIOUS REFERENCE UNIT POWER OF 750 MW HAD BEEN ESTABLISHED PRIOR TO THE UNIT 3 RESTART AND NEEDED SUFFICIENT ACTUAL OUTPUT RESULTS BEFORE THIS COULD BE UPDATED. ENGINEERING ANALYSIS AND MANAGEMENT HAS ACCEPTED THAT UNIT OUTPUT WILL BE LOWER.

### 4. 2008 Summary of Operation

NET PRODUCTION WAS 7 066,0 GWH, WHICH IS A GOOD PRODUCTION OUTPUT IN THE OLKILUOTO NUCLEAR POWER PLANT HISTORY. CAPACITY FACTOR WAS 93,7 %. PLANT UNIT HAD AN EXTENSIVE OUTAGE IN MAY THAT TOOK A LITTLE OVER TWO WEEKS (20 DAYS AND 9 HOURS) TO COMPLETE. MAJOR WORKS AT OUTAGE WERE RENOVATION OF MAIN GENERATOR VOLTAGE REGULATOR, OPENING OF TWO LOW PRESSURE TURBINES AND CONTAINMENT PRESSURE TEST.WHEN THE PLANT WAS STARTING AFTER AN ANNUAL OUTAGE, FAULT IN GENERATOR VOLTAGE SYSTEM CAUSE THE GENERATOR AND PLANT BREAKER OPEN AND REACTOR SCRAM.

### 4. 2008 Summary of Operation

2008 SHOWS AN AVAILABILITY RATE STRICTLY IDENTICAL TO 2007 - 68.8% FOR A TARGET SET AT 80%. SEVERAL CONTINGENCIES ARE BEHIND THIS FAILURE TO MEET THE TARGET. IN THE END, THE REACTOR OPERATED FOR 217 DAYS, WHICH MAKES 2008 THE SECOND BEST YEAR FOR POWER GENERATION SINCE THE RESTART IN 2003. THE GROSS ELECTRICITY GENERATION WAS 725,481 MWH IN 2008. THE MARCOULE CENTRE WAS HEATED BY TAKING FROM THE PHÉNIX STEAM: 23,000 TONNES OF STEAM, I.E. SAVINGS OF 3,600 TONNES OF CO<sub>2</sub>. DURING THE MAJOR WORK IN OUTAGE A9, ELEVEN CONTINGENCIES DISTURBED THE SEQUENCE OF INTERVENTIONS; THE EXEMPLARY REACTION BY THE PERSONNEL REDUCED THE DELAY TO 13 DAYS AS TO COMPARE WITH A 36 DAY PLANNED PERIOD. THE A10 OUTAGE, INCLUDING THE MALFUNCTION OF A STEAM ISOLATION VALVE IN A STEAM GENERATOR, LASTED 18.5 DAYS MORE THAN PLANNED INITIALLY. THERE WERE NINE UNSCHEDULED OUTAGES DURING THE YEAR; THIS IS HIGH BUT HAD LITTLE IMPACT ON OUR ELECTRICITY GENERATION THANKS TO THE REACTION AND EFFICIENCY OF ALL CONCERNED. THE FIRST "END-OF-LIFE" TEST WAS CONCLUDED SUCCESSFULLY IN MAY 2008. IT INVOLVED MEASURING THE DECAY POWER OF THE CORE USING A CALORIMETRIC METHOD TO MONITOR CHANGES IN THE CORE TEMPERATURE. THE TRIPLE CERTIFICATION (ISO 9001, 14001 AND OHSAS 18001) OF OUR ACTIVITIES AND PROCESSES WAS OBTAINED BY THE DEN AT THE END OF 2008.

### 4. 2008 Summary of Operation

FIRST UNIT OF MOCHOVCE NPP WAS OPERATED AT FULL POWER IN A BASE LOAD MODE. A LOAD-FOLLOWING HAS BEEN REQUIRED BY DISPATCHER FOR A PERIOD. UNIT PROVIDES GRID SUPPORTING SERVICES - SECONDARY POWER CONTROL FOR GRID ADJUSTMENT AND TERTIARY POWER CONTROL. DURING THE GENERAL OVERHAUL THE PRIMARY POWER CONTROL (GRID FREQUENCY CONTROL) AT BOTH TURBOGENERATORS HAS BEEN ACCOMPLISHED AS WELL. REACTOR POWER WAS UP-RATED TO 107% - FROM INITIAL 1375 MWTH TO 1471 MW THERMAL. SEVERAL PLANNED TESTS AT UP-RATED POWER WERE MADE. OVER THE REPORTING PERIOD THERE WERE FEW FORCED UNPLANNED POWER REDUCTIONS. THROUGHOUT THE YEAR THERE WAS THE UNEXPECTED DELAY OF TWO PLANNED OUTAGES: OF 1G09 AND OF CONDENSER TIGHTNESS CONTROL. THE REACTOR POWER DECREASE DURING THE LOSS OF RESERVE GRID 110 KV AT 1.ST UNIT WAS CLASSIFIED BY NATIONAL DISPATCHING AS EXTERNAL DUE TO GRID PROBLEMS. ONE MANUAL REACTOR SCRAM WAS DONE DUE TO AC POWER SUPPLY PROTECTION FALSE ACTUATION. OTHER FACTORS AFFECTING ENERGY GENERATION OVER THE REPORTING PERIOD WERE LIMITATIONS DUE TO FUEL MANAGEMENT AND ENVIRONMENTAL CONDITIONS (COOLING WATER TEMPERATURE LIMITS).

### 4. 2008 Summary of Operation

SECOND UNIT OF NPP MOCHOVCE WAS OPERATED LARGELY AT FULL POWER IN A BASE LOAD MODE. A LOAD-FOLLOWING HAS BEEN REQUIRED BY DISPATCHER FOR A PERIOD. UNIT PROVIDES GRID SUPPORTING SERVICES - SECONDARY POWER CONTROL FOR GRID ADJUSTMENT AND TERTIARY POWER CONTROL. DURING THE GENERAL OVERHAUL THE PRIMARY POWER CONTROL (GRID FREQUENCY CONTROL) AT BOTH TURBOGENERATORS HAS BEEN ACCOMPLISHED AS WELL. REACTOR POWER WAS UP-RATED TO 107% - FROM INITIAL 1375 MWTH TO 1471 MW THERMAL. SEVERAL PLANNED TESTS AT UP-RATED POWER WERE MADE. OVER THE REPORTING PERIOD THERE WERE A FEW HOURS OF UNPLANNED POWER DECREASE. THROUGHOUT THE YEAR THERE OCCURRED FALSE ACTUATION OF ELECTRICAL PROTECTIONS AND TG21 WAS TWICE DISCONNECTED FROM THE GRID. ONE AUTOMATIC REACTOR SCRAM OCCURRED DURING THE LOSS OF 400 KV GRID AT 2.ND UNIT. THIS WAS CLASSIFIED BY NATIONAL DISPATCHING AS INCORRECT ACTUATION OF UNIT'S ELECTRICAL PROTECTIONS DESPITE THE SIMULTANEOUS GRID PROBLEMS. ALL PLANNED MAINTENANCE ACTIVITIES WERE EARLIER ACCOMPLISHED AND JUST SPRING UNIT OUTAGE FOR INSPECTION OF COMMON SERVICE WATER SYSTEMS HAD STARTED ONE HOUR EARLIER THAN SCHEDULED. ADDITIONAL FACTOR AFFECTING ENERGY GENERATION OVER THE REPORTING PERIOD WERE LIMITATIONS DUE COOLING WATER TEMPERATURE LIMITS.

## 4. 2008 Summary of Operation

IN 2008 THE POWER PLANT HAD ONE UNPLANNED SHUTDOWN. ON 4 JUNE 2008 OPERATORS DETECTED AN INCREASED LEAKAGE OF WATER FROM THE PRIMARY SYSTEM INSIDE THE CONTAINMENT. THE PLANT STARTED TO DECREASE POWER AT A STEADY RATE UNTIL SHUT DOWN. IT WAS FOUND OUT THAT THE SEAL DEGRADED ON A VALVE ON ONE OF THE SMALLER PIPES, WHICH WERE CONNECTED TO THE PRIMARY SYSTEM. IN 2008 THERE WAS NO REFUELING OUTAGE.

### 4. 2008 Summary of Operation

ON 19/06/08 AN UNPLANNED AUTOMATIC SCRAM OCCURRED DUE TO AN OVERPRESSURE IN THE REGULATOR TO MAIN TRANSFORMER (TP2), WITH A DURATION OF AROUND 4 DAYS. ON 24/08/2008 AT 08:49 HOURS, WHILE THE PLANT WAS AT 100% NOMINAL POWER, A NON-PROGRAMMED AUTOMATIC SHUTDOWN OF THE REACTOR OCCURRED DUE TO A TURBINE TRIP, THE PLANT BEING AT ABOVE 34% POWER. THE SHUTDOWN OF THE TURBINE OCCURRED BECAUSE OF THE ACTUATION OF THE MAIN TRANSFORMER DIFFERENTIAL PROTECTION CAUSED BY A GROUND FAULT IN THE 21 KV "S" PHASE OF THE MAIN GENERATOR OUTPUT TO THE MAIN TRANSFORMER. EIGHT SECONDS AFTER THE SHUTDOWN SIGNAL, THE FIRE PREVENTION SYSTEM WAS ACTIVATED WHEN A FIRE WAS DETECTED IN THE AREA OF THE MAIN ELECTRIC GENERATOR. THIS MEANT THE DECLARATION OF EMERGENCY PRE-ALERT DUE TO EVENT 1.3.1. "FIRE OF DURATION EXCEEDING 10 MINUTES SINCE CONFIRMATION, WHICH DOES NOT AFFECT SAFETY SYSTEMS". THE FIRE STARTED IN THE LEAD CONDUIT BOX OF THE MAIN GENERATOR NEUTRAL CAUSING DAMAGE TO THE PANEL SHELL WHICH CONTAINS THE STAR CONNECTION AND THE NEUTRAL GROUNDING DEVICE OF THIS EQUIPMENT, ALSO TO THE HYDROGEN SUPPLY SYSTEM TO THE MAIN GENERATOR AND TO THE INSULATION OF THE ADJACENT ISOPHASE BUSES. AT 10:00 HOURS, THE FIRE WAS COMPLETELY EXTINGUISHED AND THE END OF THE PRE-ALERT WAS DECLARED AT 10:30 HOURS. THE PLANT WAS STOPPED 53 DAYS. ON OCTOBER THE PLANT WAS STOPPED 6 DAYS TO COMPLETE A PROGRAMME OF SPECIAL TEST IN THE ALTERNATOR. THE NEAR OUTAGE STOP FOR REFUELING IS FORESEEN FOR MARCH, 2009.

### 4. 2008 Summary of Operation

IN 2006 WE EXCHANGED LOWPRESSURE TURBIN. AND IN 2007 WE EXCHANGED HIGHPRESSURE TURBIN, WE CALCULATIED WITH 1045 MW, BUT IT STOPPED WITH 985 MW. IN JANUARY 2009 WE HAVE SET RUP(NET) TO 1000 MW AFTER NEW CALCULATIONS.

### 4. 2008 Summary of Operation

NORMAL OPERATION WITHOUT ANY MAYOR PROBLEMS. FROM JANUARY 15 TO 25 AN ON-LINE NOBLE METAL CHEMICAL APPLICATION WAS PERFORMED TO PROTECT REACTOR PRESSURE VESSEL INTERNALS. BESIDE JUNE 12 AND NOVEMBER 15 THE PLANT OPERATED WITH FULL LOAD EXCEPT FOR A FEW LOAD REDUCTIONS TO CARRY OUT SURVEILLANCE TESTS, ROD PATTERN CHANGES AS WELL AS MINOR REPAIRS. ON JUNE 12 A TURBINE TRIP OF TRAIN A AND AN AUTOMATIC POWER REDUCTION OCCURED . THE REASON WAS A MALFUNCTION OF A COMPONENT FOR THE TURBINE SPEED CONTROL. FROM AUGUST 10 TO SEPTEMBER 6 THE ANNUAL REFUELING AND MAINTENANCE OUTAGE TOOK PLACE. DURING A PLANNED ROD SCRAM TIME TEST ON NOVEMBER 15 A REACTOR SCRAM TOOK PLACE. THE CAUSE WAS A DELAYED RESETING OF THE TESTING MODE. DURING THE WHOLE YEAR THE HYDROGEN INJECTION WAS IN SERVICE
