INTRODUCTION

This is the twenty-fifth edition of Reference Data Series No. 2, *Nuclear Power Reactors in the World*, which is published once per year, to present the most recent reactor data available to the Agency. It contains the following summarized information:

- General information as of the end of 2004 on power reactors operating or under construction, and shut down;
- Performance data on reactors operating in the Agency's Member States, as reported to the IAEA.

The information is collected by the Agency by circulating questionnaires to Member States through the designated national correspondents. The replies are used to maintain computerized files on general and design data of, and operating experience with, power reactors.

The Agency's Power Reactor Information System (PRIS) comprising the above files provides all the information and data previously published in the Agency's *Power Reactors in Member States* and currently published in the Agency's *Operating Experience with Nuclear Power Stations in Member States* and available at the Internet address <http://www.iaea.org/programmes/a2>. Enquiries should be addressed to:

Definitions

Performance Factors

$$\text{LF (\%)} = \frac{\text{EG}}{\text{REG}} \times 100$$

$$\text{UCF (\%)} = \frac{(\text{REG} - \text{PEL} - \text{UEL}) \times 100}{\text{REG}}$$

where

- LF (%) is the load factor, expressed in per cent.
- EG is the net electrical energy (MW(e)·h) produced during the reference period under consideration.
- REG is the net electrical energy (MW(e)·h) which would have been produced at maximum net capacity C_n (MW(e)) under continuous operation during the entire reference period.
- UCF (%) is the unit capability factor, expressed in per cent.
- PEL is the planned energy loss: the energy (MW(e)·h) that was not produced during the period because of planned shut-downs or load reductions due to causes under plant management control. Energy losses are considered planned if they are scheduled at least four weeks in advance.
- UEL is the unplanned energy loss: the energy (MW(e)·h) that was not produced during the period because of unplanned shut-downs, outage extensions, or load reductions due to causes under plant management control. Energy losses are considered to be unplanned if they are not scheduled at least four weeks in advance.

Construction Start

Date when first major placing of concrete, usually for the base mat of the reactor building, is done.

First Criticality

Date when the reactor is made critical for the first time.

Grid Connection

Date when the plant is first connected to the electrical grid for the supply of power.

Commercial Operation

Date when the plant is handed over by the contractors to the owner and declared officially to be in commercial operation.

Shutdown

Date when the plant is officially declared to be shut down by the owner and taken out of operation permanently.

Units and Energy Conversion

1 terawatt-hour (TW(e)·h) = 10^6 megawatt-hours (MW(e)·h).

For an average power plant,

1 TW(e)·h = 0.39 megatonnes of coal equivalent (input)

= 0.23 megatonnes of oil equivalent (input)

Note: *Net capacity and energy values are used in all calculations.*

Note 1: Performance factors calculated only for period of full commercial operation, and only to 2003.

Note 2: No operating experience data is available in IAEA PRIS for this reactor.

Note 3: Cumulative performance factors for multiple unit stations are calculated for the whole station.

Note 4: The column Non Electrical Applications indicates the use of the facility to provide: DS desalination, DH district heating, PH process heating, N/A not applicable.

Status as of 31 December 2004, 440 reactors (366293 MW(e)) were in operation, including 6 units (4884 MW(e)) in Taiwan, China.

Status as of 31 December 2004. 108 reactors (34883 MW(e)) are permanently shut down.
 One reactor in Canada, Bruce-3 was reconnected to the grid in 2003 and hence has been removed from this table.
 In Canada Bruce 1,2 and Pickering 1,2,3 might restart in the future.
