Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January-April, June-December. Additional electricity generation amounted to 376796 MWh. The unit was in the intermediate maintenance outage from 2023.05.13 to 2023.06.10. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in February-December. Additional electricity generation amounted to 402761 MWh. The unit was in the overhaul outage from 2023.01.01 to 2023.02.03. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Federal Tariffs Service. Unit operation at power level above installed capacity took place in January-August. Additional electricity generation amounted to 56623 MWh. The unit was in the routine maintenance outage from 2023.03.23 to 2023.04.08 and the intermediate maintenance outage from 2023.08.24 to 2023.12.28. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. The unit was in the intermediate maintenance outage from 2023.06.11 to 2023.07.07. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. The unit was in the intermediate maintenance outage from 2023.04.08 to 2023.06.10. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in June, December. Additional electricity generation amounted to 1071 MWh. The unit was in the intermediate maintenance outage from 2023.03.10 to 2023.04.27. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in March-July, November-December. Additional electricity generation amounted to 18602 MWh. The unit was in the intermediate maintenance outage from 2023.08.24 to 2023.10.04. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in August-December. Additional electricity generation amounted to 40285 MWh. The unit was in the overhaul outage from 2023.06.04 to 2023.08.21. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January-April, October-December. Additional electricity generation amounted to 95702 MWh. The unit was in the routine maintenance from 2023.05.25 to 2023.08.12. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January-May, October-December. Additional electricity generation amounted to 148610 MWh. The unit was in the intermediate maintenance outage from 2023.08.18 to 2023.10.12. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January, April-December. Additional electricity generation amounted to 74711 MWh. The unit was in the unit overhaul from 2023.01.17 to 2023.04.09. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January-April, October-December. Additional electricity generation amounted to 39248 MWh. The unit was in the unit overhaul from 2023.01.01 to 2023.01.08. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January-June, October-December. Additional electricity generation amounted to 122728 MWh. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

The Russian NPPs are operating in the baseload mode agreed with the Russia's Federal Energy Commission. Unit operation at power level above installed capacity took place in January-February, April-December. Additional electricity generation amounted to 236885 MWh. The unit was in the intermediate maintenance outage from 2023.02.12 to 2023.03.23. Radionuclides content in the monitored environmental objects in the plant vicinity was on the level of average background values typical for the European part of the Russian Federation.

Highlights (2023)

31.01.2023, 07.02.-08.02.2023 ancillary services testing and certification (aFRR-, mFRR-). Operation without any planned or unplanned power decreasing. Steam extraction for district heating exchanger.

11.06. - 14.06.2023 coast-down operation.

14.06.-16.06.2023 reactor power decreasing to 82 % due to water level increasing in moisture separator/reheater (SPP) TG31.

16.06. - 11.07.2023 annual maintenance and refuelling, start-up operation, scheduled measuring and testing.

From 14.07.2023 steam extraction for district heating exchanger.

Highlights (2023)

MOCHOVCE 1 unit was operated at full power in base load mode in 2023. Throughout the year there were no reactor scram and no unplanned full outage. The total unplanned losses of 31.1 GWh were largely due to the extended general overhaul of the unit. During the start-up after the general overhaul TG12 was shut down unscheduled due to overheating of current connections on TG exciter. Another manual shutdown of TG12 occurred in May. Planned production losses of 219.8 GWh included general overhaul with fuel replacement in April, execution of planned tests and losses due to cooling tower refurbishment between January and March. Other factors affecting energy generation were limitations due to environmental conditions and site heating. During the year the unit provided supporting services for grid adjustment.

Highlights (2023)

MOCHOVCE 2 unit was operated at full power in base load mode in 2023. Throughout the year there were no reactor scram and no unplanned full outage. Annual value of the unplanned energy losses of 9.6 GWh was mainly due to the extension of the general overhaul with refueling. Planned energy losses of 210.9 GWh included the general overhaul with refueling in September, supporting services recertifications and losses due to cooling tower refurbishment between January and March. Other factors affecting energy generation were limitations due to environmental conditions and site heating. During the year the unit provided supporting services for grid adjustment.
