FOREWORD

This report is the fifty-fifth in the IAEA's series of annual reports on operating experience with nuclear power stations worldwide.

As in previous years, in addition to annual performance data and outage information, the report contains statistical information on electricity production and the overall performance of individual nuclear power plants that were in operation in the reporting year. In addition to annual information, the report contains a historical summary of performance during the lifetime of individual reactors and showcases worldwide performance data of the nuclear industry.

The intent behind this report, and all related IAEA publications, is to provide a useful tool for everyone concerned with nuclear power. Suggestions and queries from readers are most welcome.

1. INTRODUCTION

The 2024 edition of this publication contains integrated reports combining nuclear reactor operating experience data with design characteristics and dashboards. The integrated report provides a general overview of each individual operating nuclear power reactor that was in operation in 2023.

The publication provides annual performance data and outage information for individual nuclear power plants. Summaries of historical performance and outages during the lifetimes of those plants are also included. In order to provide a broad picture of nuclear power usage, six figures illustrate global operational statistics up to and including 2023.

The data that form the basis of this publication are a direct output from the IAEA's Power Reactor Information System (PRIS), the database that contains all performance data published in the IAEA's operating experience annual reports since 1970, as well as basic information on power reactors, including design data. It presents operating experience data for all nuclear power plants worldwide from the start date of their commercial operation. The PRIS data is available free of charge to IAEA Member States through its public web site and on-line application, PRIS-Statistics. The web site www.iaea.org/pris contains publicly available information about reactor units and nuclear industry results. PRIS-Statistics (<http://pris.iaea.org>) provides direct access to the database. This application allows registered users to generate statistical outputs through predesigned reports and filters.

When analysing the performance of nuclear reactors, indicators such as energy production, load, operating and availability factors are often used. Energy unavailability factors, categorized separately for planned and unplanned unavailability (due either to causes under plant management control or to external causes out of plant management control), are used as a measure of energy loss when a unit is not available to the grid on full power. Despite efforts to properly classify unavailability data, some ambiguity remains in operator reports, as it is inherently difficult to find energy losses caused by load following operation and by grid limitation for externally facilitated unavailability. Therefore, for load, operation and unavailability factors, there may be differences between the data compiled in this report and data published elsewhere. For detailed information on data elements and performance indicators included in this publication, please refer to the definitions in Section 2.

Information and data received by the IAEA through 21 June 2024 are included in this publication. All commercially operating units reported data up to this date. Any modifications received at a later date, although not included in this publication, are available in the PRIS database.

The information contained in this publication was made available to the IAEA through designated national PRIS Data Providers and Liaison Officers. The IAEA appreciates the valuable assistance of the national authorities, official correspondents and various utilities in gathering the information for this report.

This publication was compiled by staff of the IAEA's Division of Nuclear Power, Nuclear Power Engineering Section. It is hoped that the publication will serve as a useful tool for nuclear power plant operators, nuclear system designers, nuclear power

planners, professional engineers, scientists and others concerned with the operating experience of nuclear power reactors. Suggestions and corrections from readers are most welcome.

2. DEFINITIONS

1. Reference unit power, RUP [$MW_{(e)}$]

The maximum (electrical) power that could be maintained continuously throughout a prolonged period of operation under reference ambient conditions.

It is specified that this value must remain constant for a given unit unless, following permanent modification, or a new permanent authorization, the management decides to amend the original value.

The reference unit power may be gross or net:

- The gross RUP (P_g , $MW_{(e)}$) is deemed to be measured at the output terminals of all generator sets in the station.
- The net RUP (P_n , $MW_{(e)}$), indicating the maximum power that can be supplied, is measured at the station outlet terminals, i.e. after deducting the power taken by station auxiliaries and the losses in the transformers that are considered integral parts of the station.

2. Design net capacity [$MW_{(e)}$]

The net reference unit power as specified in an original unit design.

3. Reference period, T [hours]

For units in power ascension at the end of the period, the clock hours from the beginning of the period or the first electrical production, whichever comes last, to the end of the period.

For units in commercial operation at the end of the period, the clock hours from the beginning of the period or of commercial operation, whichever comes last, to the end of the period or permanent shutdown, whichever comes first.

4. On-line hours, t [hours]

The total clock hours in the reference period during which the unit operated with breakers closed to the station bus.

5. Reference energy generation, REG [$MW_{(e)}h$]

Net electrical energy which would have been supplied to the grid if the unit were operated continuously at the reference unit power during the whole reference period.

6. Energy generated (net), EG [$GW_{(e)}h$]

Net electrical energy produced during the reference period as measured at the unit outlet terminals, i.e. after deducting the electrical energy taken by unit auxiliaries and the losses in transformers that are considered integral parts of the unit. If this quantity is less than zero, zero is reported.

7. Load factor, LF [%]

$$LF = \frac{EG}{REG} \times 100$$

EG = energy generated (net), [MW_(e)h]
REG = reference energy generation [MW_(e)h]

Load factor is the ratio of the energy that the power unit has produced over a given period to the energy it would have produced at its reference power capacity over that period.

8. Operation factor, OF [%]

$$OF = \frac{t}{T} \times 100$$

t = number of hours on-line [h]
T = number of hours in the reference period

Operation factor is the ratio of the number of hours the unit was on-line to the total number of hours in the reference period, expressed as a percentage. It is a measure of the unit time availability on the grid and does not depend on the operating power level.

9. Available capacity, P [MW_(e)]

Maximum net capacity at a given moment at which the unit or station is able or is authorized to be operated at a continuous rating under the prevailing conditions assuming unlimited transmission facilities.

10. Energy loss, EL [MW_(e)h]

Energy that could have been produced during the reference period by using the unavailable capacity; it is categorized into three types:

- PEL: planned energy loss
- UEL: unplanned energy loss
- XEL: energy loss due to causes external to the plant

UEL comprises shutdowns, unplanned load reductions or outage extensions.

11. Unavailability

A status when the plant is not able to operate at its maximum capacity (reference power). This condition, which may be under or beyond plant management control, should only reflect lack of availability of the plant itself, regardless of energy demand, transmission grid condition or political situation in the country.

Unavailability is classified as planned if it is foreseen at least four weeks in advance, generally at the time when the annual overhaul programme is established, and if the beginning of the unavailability period can be largely controlled and deferred by management. Unavailability is classified as unplanned if not scheduled at least four weeks in advance. Power plant operation at lower than maximum capacity because of lower demand from the grid but occurring while the plant is available to operate at the maximum capacity does not constitute unavailability, either planned or unplanned.

12. Energy availability factor, EAF [%]

$$EAF = \frac{REG - PEL - UEL - XEL}{REG} \times 100$$

The energy availability factor is the ratio of the energy that the available capacity could have produced over a specified period to the energy that the reference unit power could have produced during the same period.

13. Energy unavailability factor, EUF [%]

$$EUF = \frac{EL}{REG} \times 100$$

The unavailability factor is the ratio of the energy losses, EL, that have not been produced during a specified period due to the unavailable capacity, to the energy that the reference unit power could have produced during the same period.

The energy unavailability factor EUF over a specified period can be divided into:

PUF = planned unavailability factor

UUF = unplanned unavailability factor due to causes in the plant

XUF = unplanned unavailability factor due to causes external to the plant.

The unavailability factor can be expressed as: $EUF = 100 - EAF$

14. Unit capability factor, UCF [%]

$$UCF = \frac{REG - PEL - UEL}{REG} \times 100$$

Unit capability factor is defined as the ratio of the energy that the unit was capable of generating over a given time period considering only limitation under the plant management control to the reference energy generation over the same time period, expressed as a percentage. Both of these energy generation terms are determined relative to reference ambient conditions.

15. Unplanned capability loss factor, UCL [%]

$$UCF = \frac{UEL}{REG} \times 100$$

Unplanned capability loss factor is defined as the ratio of the unplanned energy losses during a given period of time to the reference energy generation, expressed as a percentage. Unplanned energy loss is energy that was not produced during the period because of unplanned shutdowns, outage extensions or unplanned load reductions due to causes under plant management control. Causes of energy losses are considered to be unplanned if they are not scheduled at least four weeks in advance.

16. Construction start

Date when first major placing of concrete, usually for the base mat of the reactor building, is carried out.

17. First criticality

Date when the reactor is made critical for the first time.

18. Grid connection

Date when the plant is first connected to the electrical grid to supply power.

19. Commercial operation

Date when the plant is handed over by the contractors to the owner and officially declared to be in commercial operation.

20. Permanent shutdown

Date when the plant is officially declared shut down by the owner and taken out of operation permanently.

21. Long term shutdown (Suspended operation)

A unit is considered to be in the long term shutdown status if it has been shut down for an extended period (usually several years) without initially having any firm recovery schedule but if there is the intention of re-starting the unit eventually.

22. Outages

For the purpose of PRIS coding, the outage is defined as any status of a reactor unit, when its actual output power is lower than the reference unit power for a period of time. By this definition, the outage includes both power reduction and unit shutdown. The outage is considered significant if the loss in the energy production corresponds to at least ten hours of continuous operation at the reference unit power or if it has been caused by an unplanned reactor scram (even if the unit is shut down for less than ten hours).

23. Outage duration [h]

The total clock hours of the outage measured from the beginning of the reference period or the outage, whichever comes last, to the end of the reference period or the outage, whichever comes first.

24. Factors refer to the plants which were in commercial operation during the whole of the reference period.

25. Cumulative factors are given for the plants which were in commercial operation during full calendar years.

26. A blank and three periods (...), if used in tables, denote information that is not applicable or not available.

27. Types of outages

The outage type is a three-character code. The third character is for unplanned outages only:

Code_1 description:

- (P) Planned outage due to causes under the plant management control
- (U) Unplanned outage due to causes under the plant management control
- (X) Outage due to causes beyond the plant management control ("external")

- (2) Controlled shutdown or load reduction that had to be performed in the next 24 hours after the cause occurred
- (3) Extension of planned outage

Highlights (2023)

Highlights for the year 2023

On May 5, 2023 at 01:45 the ANPP Unit 2 was shut down for annual outage-2023 which will last 75 days.

In addition to the scope of the annual outage, as part of outage-2023 a number of activities were implemented which were aimed at improving the safety of the plant operation. The employees of the main departments of the ANPP, as well as other experienced specialists from the Russian Federation, Croatia, the Czech Republic, Slovakia and other countries were involved in the work. The following main activities are scheduled to be performed during outage-2023.

- reactor intermediate maintenance with a complete core unloading,
- major overhaul of reactor coolant pumps ?2 and ?3,
- major overhaul of steam generators ?2 and ?3,
- routine maintenance of turbine generators,
- routine maintenance of steam turbines.
- activities on replacement of Unit 2 2RCP-1+6 pump units wraparound pipelines,
- improvement of reactor facility confinement leak-tightness,
- installation of a new system of boron unit air-cooling,
- installation/dismantling of the I and II channel ELCS pipelines and support & suspension system in the turbine hall,
- installation/dismantling of sections of the circulating water pipelines to cooling tower ?1 and other activities were performed.
- modernization of some of the safety systems will be carried out, such as replacing the pipelines of the Essential Load Cooling System.
- In the framework of the ANPP Unit 2 life extension project, during outage-2023 MAW type valves installed in the unit systems were replaced with valves of a new type and units 2?-1, 2?-2, 2?-4 of the air-cooling systems of the reactor facility confinement were replaced.
- installation of auxiliary equipment of turbine generators ?3 and ?4 was performed. Currently activities are underway to prepare Unit 2 for start-up after the outage.

All the activities included in outage schedule 2023 have been completed and the unit was connected to the grid on 15 of July, 2023, Unit 2 of the Armenian NPP was put into operation; activities of planned outage were finished 3 days before planned date.

Highlights (2023)

Angra 2 remained connected to the National Electrical Grid for 301,14 days in 2023 and performed its refueling outage (19th) in 52,75 days, for refueling, maintenance and routine testing.

Angra 2 operated cycle 19 and cycle 20, until the end of December, without fuel failure.

During core unloading, in the course of the 19th refueling outage, although in smaller quantities, the appearance of white particles falling from the Fuel Elements (ECs) during Unloading was observed, indicating the presence of the corrosion phenomenon in some ECs of the Cycle 19 core. As planned, during the visual inspection of all ECs that would return to the cycle 20 core, it was observed that they presented an oxidation level within the expected range for the relative burning of each EC. During the 2P19 refueling outage in this measurement activity, good corrosion performance was observed, without any indication of advanced corrosion and with maximum oxide thicknesses with values within those expected for the burning of each EC measured, allowing the safe and reliable return of the Plant to operation and demonstrating that the measures taken by Eletronuclear to resolve the issue of surface oxidation of the coating on the EC rods presented the expected result.

On February 18th 2023, Angra 2 Turbine automatically shutdown due to the activation of the Generator Rotor Ground Fault Protection. On the same day, the Reactor was manually shutdown. After evaluations, performing "Feed and Bleed" of the Generator Cooling System (MKF), Megger measurement and mainly the emergency chemical cleaning of the Rotor, the plant was reconnected to the grid on February 24th 2023.

On March 8, the power was reduced to 80% Nominal Power (PN), due to the reduction in the insulation resistance of the electric generator rotor.

The plant remained at 80% PN until March 10th, when the power reduction of the Plant began, to manually shut down the Generator. On the same day, Angra 2 was disconnected from grid, with the unit's turbogenerator being manually turned off (TUSA) and the reactor turned off on the same date. After evaluations, performing "Feed and Bleed" of the Generator Cooling System (MKF), Megger measurement and mainly the chemical cleaning of the Rotor, the reactor was criticalized on March 16th. And on the same day, the unit was reconnected to grid.

On September 7th, the stretch out operation to extend an operating cycle.

On September 24th, power reduction began to shut down the plant for the beginning of the 19th Refueling Outage.

On September 25th, at 00:00, the unit was turned off, starting its 19th refueling outage (2P19).

On September 16th, the 19th Recharging Stop (2P19) was closed, with the plant synchronizing with to grid on the same date, and to start Angra 2 20th Cycle 20.

Highlights (2023)

Unit 5 was operated on base load mode at the optimal mode incl. fuel coast down mode in April.

The planned outage for annual maintenance, refueling and modernization was moved due to a maintenance at Unit 6 for one week, and was performed in the period 30th April – 5th June (total outage duration – 36.3 days). During the planned outage were carried out a number of modernizations related to the Unit life time prolongation.

Highlights (2023)

Unit 6 was operated on base load mode with optimal power. As a preventive measure the Unit #6 was shut down in April for one week for repairing Steam Generator #3 (no operational limit has been reached). The planned outage for annual maintenance, refueling and modernization was displaced due to the outage in April. Before the planned outage for annual maintenance, refueling and modernization power is reduced for scheduled measurements. Annual maintenance with refueling was performed in the period 9th October – 16th November (total outage duration – 38 days). During the planned outage were carried out a number of modernizations related to the Unit life time prolongation.

Highlights (2023)

This year, Unit 1 underwent a unit outage and one minor power reduction repair, and cooperated with the power grid to reduce power multiple times. At other times, it maintained power operation and experienced an automatic emergency shutdown event.

On April 30th at 21:50, the steam turbine generator of Unit 1 was disconnected and the OT114 refueling outage began. On May 23rd at 09:35, Unit 1 was reconnected to the grid for operation after completing major repairs. On May 25th at 20:30, the unit rose to full power operation.

On June 20th at 08:30, due to the shutdown and maintenance of 1PAC21AP001, Unit 1 reduced its power to 900MW for operation. On June 21st at 09:30, the maintenance of the circulating cooling water pump 1PAC21AP001 was completed, and the unit was put into full power operation.

On October 29th at 23:29, the condensate control valve in the second circuit of Unit 1 malfunctioned and closed, causing fluctuations in feedwater flow and resulting in low steam generator liquid level. This triggered a shutdown protection action and caused the unit to shut down. The unit was reconnected to the grid after completing defect elimination at 05:40 on October 31st.

Highlights (2023)

This year, Unit 3 has cooperated with the power grid multiple times to reduce power, while maintaining power operation at other times; This year, Unit 3 underwent a outage, one minor maintenance shutdown, and multiple power reductions in coordination with the power grid, while maintaining power operation at other times.

On March 17th at 12:05, the steam turbine generator of Unit 3 was disconnected and the OT304 material replacement overhaul began. At 16:10 on April 10th, Unit 1 was reconnected to the grid for operation after completing major repairs.

At 17:55 on April 21st, Unit 3 underwent maintenance and defect elimination of the primary low-pressure safety injection system containment isolation valve, as well as reactor disassembly inspection. It began to shut down for minor repairs and was reconnected to the grid at 12:20 on June 2nd.

Highlights (2023)

This year, Unit 4 underwent a major overhaul and experienced an unplanned power reduction event (on November 22, during the maintenance process of Unit 4's start-up transformer, backup was used)
 During the power switch transmission test, triggering the logic resulted in a decrease in reactor power. In addition, we have cooperated with the power grid multiple times this year to reduce power, while maintaining power operation for others
 The detailed information is as follows:
 On November 26th at 3:00 PM, Unit 4 began to reduce power, and on the 27th at 00:00 PM, it disconnected from the power grid and began the OT404 refueling overhaul. At 21:28 on December 23rd, the major overhaul was completed and the unit was connected to the grid.

Highlights (2023)

This year, Unit 6 has cooperated with the power grid multiple times to reduce power, while others have maintained power operation. No manual emergency shutdown events have occurred, and the detailed situation is as follows:
 Unit 6 began power reduction at 00:00 on September 29th, disconnected from the power grid at 11:02 on September 29th, and began material replacement and overhaul
 On September 29, 2023 at 11:02, Unit 6 tripped and shut down, starting the OT602 overhaul; At 04:52 on October 20th, the grid connection conditions were met, and the OT602 material replacement overhaul was completed. The actual construction period was 20.74 days.
 Due to the large amount of new energy generation and difficulties in balancing the power grid, the unit was actually reconnected to the grid for operation at 13:48 on October 20th, and rose to full power operation at 05:40 on October 23rd

Highlights (2023)

Unit 1 of Yangjiang Nuclear Power Plant had a turbine trip on April 12, 2023, and re-connected to the grid on April 13. The unit operated at full power at all times except during holidays and grid line maintenance in which it operated at reduced power in order to cooperate with peak shaving of the grid. No scrams has occurred throughout the year.

Highlights (2023)

Unit 2 of Yangjiang Nuclear Power Plant was disconnected from the grid for Y206 outage on August 29, 2023, and re-connected to the grid on September 18. The unit operated at full power at all times except during holidays and grid line maintenance in which it operated at reduced power in order to cooperate with peak shaving of the grid (including 1 shutdown for standby to cooperate with the grid). No scrams has occurred throughout the year.

Highlights (2023)

The Temelín Nuclear Power Plant will enter the final phase of approval of an extension of the outage cycle to 18 months. CEZ put into trial operation the third longest hot water piping in Czechia, connecting the Temelín Nuclear Power Plant and the regional city of České Budějovice; the expected annual supply of 750 TJ of emission-free heat corresponds to approximately one-third of the city's heat consumption and should be available for at least 20 years.

Highlights (2023)

The electricity production of the Olkiluoto power plant units OL1, OL2 and OL3 during 2023 was 24,671 GWh.

OL1's net production was 7,428 GWh.

The annual outages of 2023 at the Olkiluoto nuclear power plant were carried out from April 16 to May 19, 2023. OL2 was performed a maintenance outage taking more than 17 days, and OL1 performed a refueling outage that lasted over 10 days. The annual outage period was about four days longer than expected. The schedule was affected mainly from relief system. In all other respects annual outages were implemented according to plans. The OL3 plant unit first annual outage starts on March 3, 2024.

Highlights (2023)

The electricity production of the Olkiluoto power plant units OL1, OL2 and OL3 during 2023 was 24,671 GWh.

OL2's net production was 6,871 GWh.

OL2 plant unit was out of production from January 27 to January 29 due to repair of one main steam line valve. After annual outage during the start-up operation on May 19 there happened automatic scram due to high conductivity in condenser.

There was cold shutdown due to leak in main generator cooling system from August 18 to September 4.

The annual outages of 2023 at the Olkiluoto nuclear power plant were carried out from April 16 to May 19, 2023. OL2 was performed a maintenance outage taking more than 17 days, and OL1 performed a refueling outage that lasted over 10 days. The annual outage period was about four days longer than expected. The schedule was affected mainly from relief system. In all other respects annual outages were implemented according to plans. The OL3 plant unit first annual outage starts on March 3, 2024.

Highlights (2023)

The electricity production of the Olkiluoto power plant units OL1, OL2 and OL3 during 2023 was 24,671 GWh.

OL3's net production was 10,372 GWh.

OL3 plant unit commissioning phase continued until January 10, when cold shutdown started due to feedwater pumps inspections. Cold shutdown due to feedwater pumps inspections and replacement of impellers ended February 5. February 12 the plant unit decided to run in cold shutdown due to inspections and maintenance of pressurizer valves. The maintenance works were completed in March 8th. Commissioning phase continued until April 16, when regular electricity production started.

Commercial operation started May 1. The plant unit has produced electricity throughout the rest of the year expect for two turbine trips in November. The first happened on November 19 due to failure in temperature measurement of the generator cooling system. Production continued November 22. The second turbine trip happened on November 29 because of the near failure test. Production continued November 30. The power of the plant unit has been limited from time to time by the system protection, grid limitation and also low demand of electricity.

The OL3 plant unit first annual outage starts on March 3, 2024.
