Production of $A+1$ and $Z+1$ isotopes in $p\text{-}^A\text{Z}$ reactions.

Application to $p\text{-}^{208}\text{Pb}$ and $p\text{-}^{209}\text{Bi}$.

J. CUGNON (ULg), Th. AOUST (SCK-CEN & AVN-Belgium)

INCL4 Collaboration

- Introduction
- Special channels and special dynamics for special isotopes
- Importance of pion-producing channels
- Test of INCL4.4.3: Emphasis on the energy-dependence of the nuclear mean field
- Importance for radiotoxicity
- Conclusion

1. Introduction

^{238}U (1 A GeV) + ^1H

Ricciardi et al, PRC 73 (2006) 014607

^{238}U (1 A GeV) + ^1H

Ricciardi et al, PRC 73 (2006) 014607

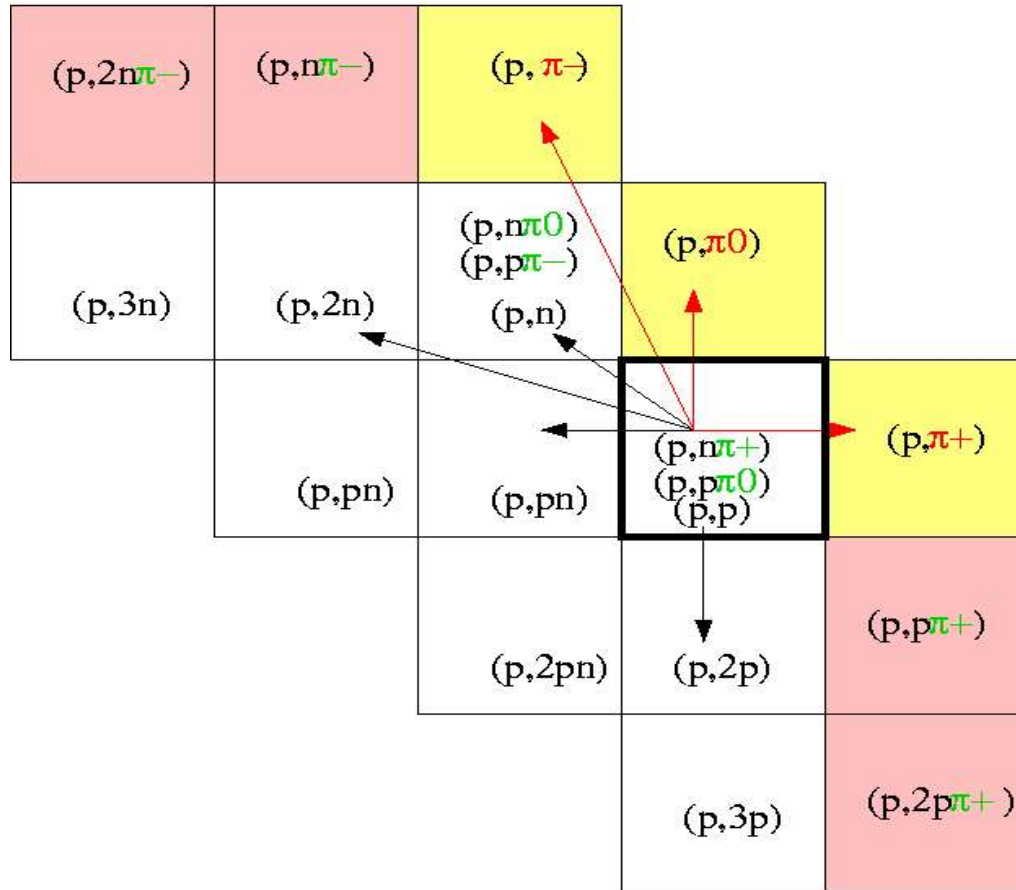

2. Special channels

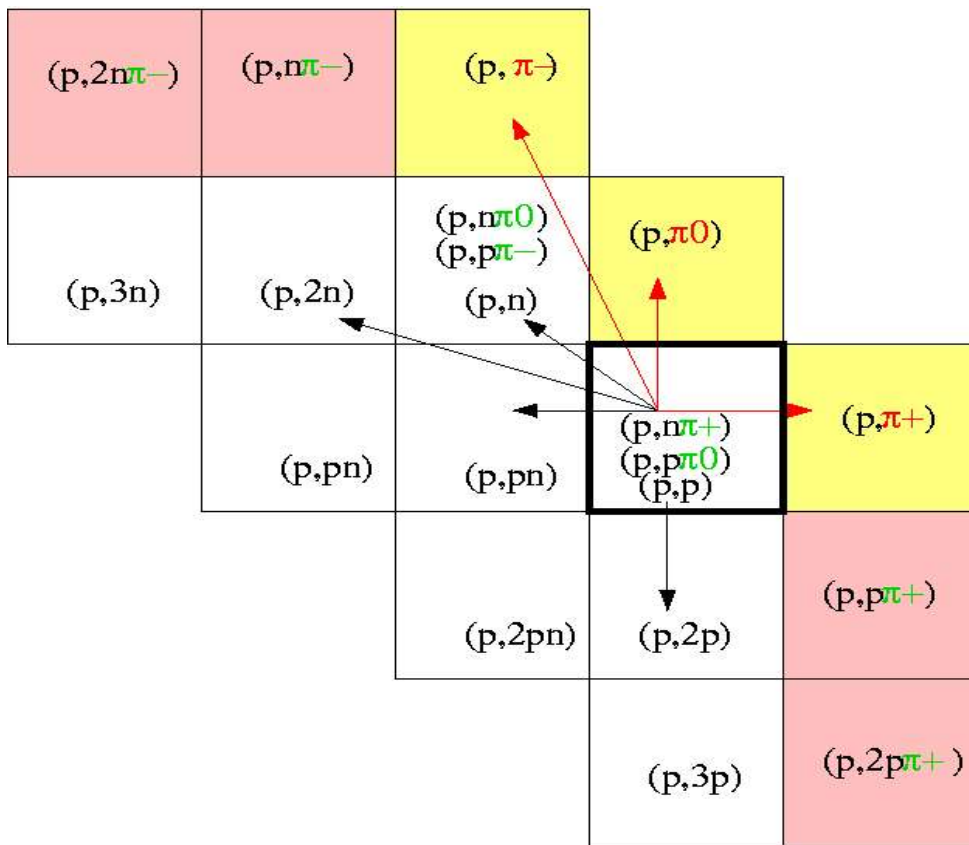

Production of $A+1$ isotopes = single scattering with stringent kinematical conditions

Production of $Z+2$ isotopes =
at least one inelastic scattering

- Production of ${}^A(Z+2)$ = one single inelastic scattering with constraints:
no further interaction for the pion and one nucleon trapped (only)
- Production of ${}^{(A-1)}(Z+2)$ = two scatterings with constraints:
no further interaction for the pion and one nucleon trapped (only)

Production of $Z+1$ isotopes = more dynamical paths, less constraint

- Production of ${}^A(Z+1)$ = one single elastic scattering with constraints: no further interaction for one of the nucleons; but also one inelastic collisions with no further interaction for the pion and one of the nucleons
- Production of ${}^{(A-1)}(Z+1)$ = two elastic scatterings or one elastic and one inelastic collisions

3. Importance of pion production

1. production of a given isotope

single channel

simple dynamical path

2. importance of pion production channels

A good test for INC models

4. INCL4

brief description of INCL4.2=standard version:

- ordered & separated NN collisions
- elastic or inelastic
- subject to Pauli blocking†
- potential well†
- transmission, reflection, (refraction)†
- stochasticity†
- relativistic kinematics
- isospin degree of freedom

INCL4.4.3

- isospin and energy-dependence of the potential well depth
- average potential well for pions
- strict Pauli blocking on the first collision

INCL4.5 (composites+low energy features): see satellite meeting

Here: coupled to ABLA fission-evaporation code.

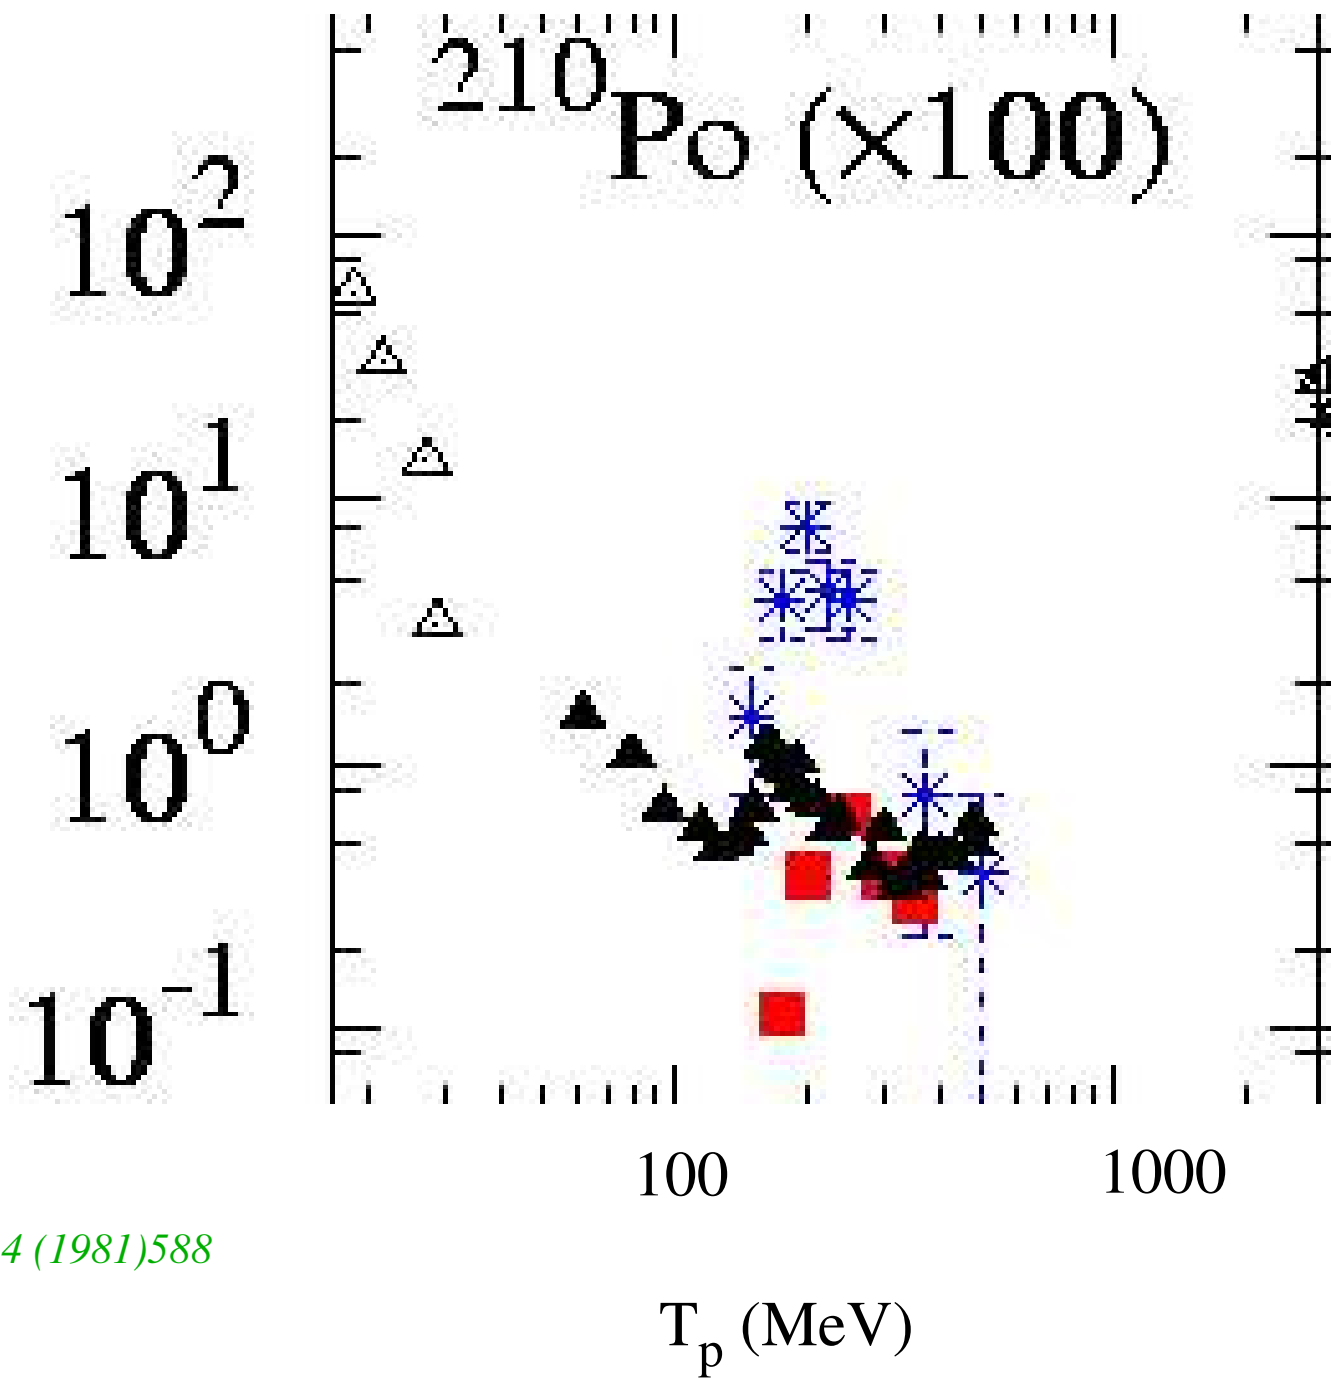

5. Results

- Production of A+1 isotopes in $p+^{209}\text{Bi}$: ^{210}Po
- Production of Z+1 isotopes in $p+^{209}\text{Bi}$: $^{209}\text{Po}, ^{208}\text{Po}, \dots$
- Production of Z+1 isotopes in $p+^{208}\text{Pb}$: Bi

$p + ^{209}\text{Bi}$

A+1

T.E. Ward et al, PRC24 (1981)588

_____ INCL4.2

_____ + Isospin-dependent N potential

_____ + E-dependent N potential

_____ + pion potential

_____ + strict Pauli blocking on 1st collision
=INCL4.4.3

Conservation of energy for collisions of particles moving in potential well

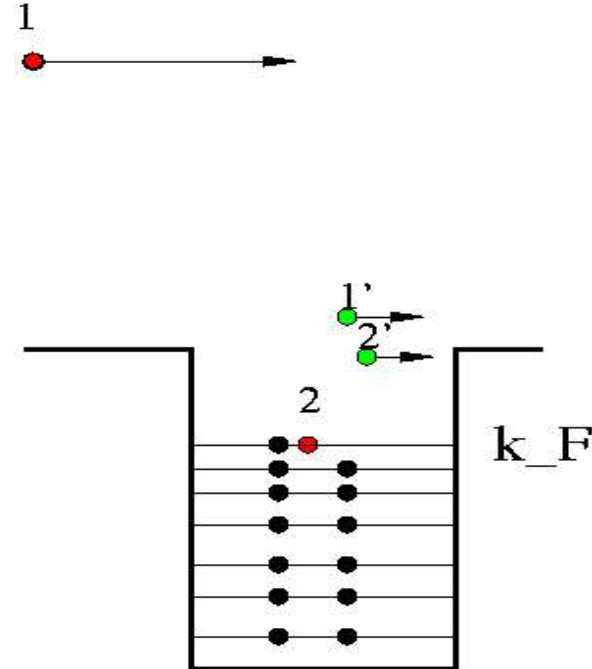

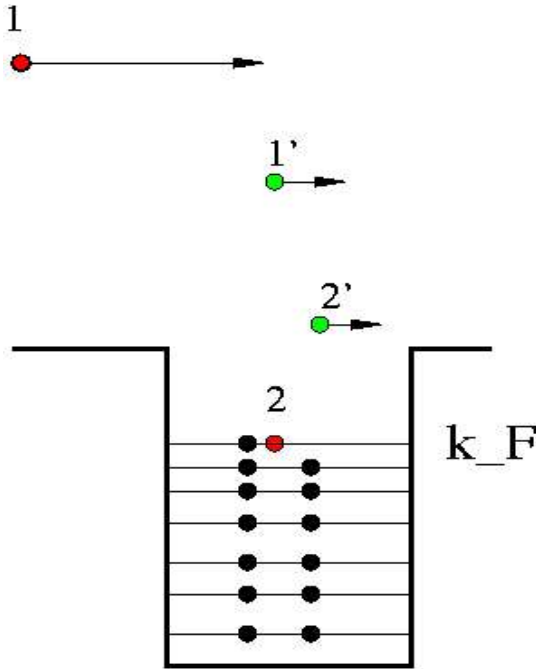

Optical model: linear dependence in $V(E)$

EL

INEL

$$E_1 + V(E_1) + E_2 + V(E_2) = E'_1 + V(E'_1) + E'_2 + V(E'_2)$$

$$E_1 + V(E_1) + E_2 + V(E_2) = E'_1 + V(E'_1) + E'_2 + V(E'_2) + \Delta M c^2$$

$$E'_1 + E'_2 \approx E_1 + E_2$$

$$V(E'_1) + V(E'_2) \approx V(E_1) + V(E_2)$$

$$E'_1 + E'_2 < E_1 + E_2$$

$$V(E'_1) + V(E'_2) > V(E_1) + V(E_2)$$

Effective negative extra Q-value

The energy-dependence leaves a fingerprint in
single-inelastic scattering events

It is washed out in other events

Z+1

$p + ^{209}\text{Bi}$

$p + ^{209}\text{Bi}$

Bi isotopes: Z+1

p(1 GeV)+²⁰⁸Pb

$p+^{208}\text{Pb}$

Z+1

6. Applications to Pb-Bi targets

alternate disks of Pb-Bi
3rd disk in Bi

K. Van der Meer et al
NIM Phys. Res. B217
(2004) 202

7. Conclusion

- For residues close to target, identification of channels and mechanisms
- Pion production channels are important
- Pion fusion ($A+1$) is dominated by incoherent process
- Bears the fingerprint of the energy-dependence of the nucleon potential
- Improved version of INCL4 is successful
- May be of importance for radiotoxicity studies
